

## Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

## Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

- + *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
- + *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
- + *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
- + *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

## Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter <http://books.google.com> durchsuchen.

# SUTTON'S SEEDS

## TABLE DAINTIES

For reliability in cropping, excellence of appearance and superior table quality our pedigree strains of Vegetables are unsurpassed.

On the Exhibition stage during 1926 they have, once again, been awarded the highest honours, receiving **GOLD MEDALS** at the following Shows:

Royal Horticultural Society's Vegetable Show; Glasgow; North of England Horticultural Show; Bournemouth; Eastbourne; Plymouth; Isle of Wight, and Brentford.

At the R.H.S. Vegetable Show, our customers won 27 out of the 38 First Prizes offered in Open Competition.

*Following are a few of our choicest varieties, that should be grown in every garden:*

PEAS	Sutton's Pioneer, per pint 2/6, quart 4/6

**COLOURED SUPPLEMENT PLATE.**  
Begonia La Patrie.

**AVERAGE MEAN TEMPERATURE** for the ensuing week deduced from observations during the last fifty years at Greenwich, 38.1.

**ACTUAL TEMPERATURE**—  
The *Gardeners' Chronicle* Office, 5, Tavistock Street, Covent Garden, London, Wednesday, December 29, 10 a.m. Bar. 30.2. Temp. 40°. Weather, Sunny.

**Forcing Plants by Carbon Dioxide.**

THE interesting investigation into the effects produced on crops by increasing the amount of carbon dioxide in the atmosphere in which the plants are growing, which has now been in progress at the Experimental Station, Cheshunt, Hertfordshire, has been brought a long step nearer successful completion.\* The earlier work on this subject carried out at the station was, as has already been outlined in this Journal (August 23, 1924) of a preliminary nature. Since that time methods have been devised whereby plants, grown on an experimental scale, may be subjected for several hours of the day to an atmosphere artificially enriched by known quantities of

\*Carbon dioxide in relation to Glass House crops. III. The effect of enriched atmospheres on Tomatos and Cucumbers, by C. Owen T. Snell and P. H. Williams. *Annals of Applied Biology*, November, 1926.

carbon dioxide. Needless to say, so illusive a substance as carbon dioxide, even when discharged in large quantities into a glass-house, refuses to maintain its concentration. It begins to escape in one way or another so that if a high concentration is to be maintained, even for a few hours, supplies of the gas must be forced into the house at intervals. In spite of the rapidity at which the initial concentration falls, these means suffice to produce an atmosphere containing a far larger quantity of CO<sub>2</sub> than occurs in ordinary air. Hence, it has become possible to ascertain by actual cultivation whether these larger quantities of the gas lead to increased crop production. Theoretically, they ought to do so. Plants are avid of carbon dioxide. From it all their carbohydrates—sugar, starch, etc., are derived. Yet the natural atmosphere contains only four or five parts in ten thousand. Surely, therefore, plants which possess in the stomata of their leaves a most efficient apparatus for absorbing carbon dioxide, should, if they had access to larger supplies, grow more and produce more fruit. Those who are most suspicious of *a priori* arguments will be the most pleased to learn that in this case their suspicions are dissipated by the experimental facts. Thus the authors show that Tomatos which received during two hours of each day a greatly increased ration of carbon dioxide, six per cent., as against the normal four parts in ten thousand, produced no less than twenty-five per cent. more fruit in consequence of the use of this gaseous fertilizer. Nor is there any need apparently to start gassing the plants too soon. As tiny seedlings they do not respond to the treatment. But when the enrichment of atmospheric carbon dioxide begins about three weeks after sowing, the Tomato responds by producing twenty-five per cent. more fruit, and the Cucumber by yielding sixteen per cent. more. Monthly records of the crop produced show, moreover, the very curious and obliging fact that the plant responds most at those seasons when its market price is highest. From May and June, the yield from the gassed plants is markedly higher than is that from plants cultivated normally. In July and August, when our thoughts are turned away from the Tomato and directed toward the hope of Strawberries and Plums, the plants, tempted by copious supplies of carbon dioxide, produce few, if any more, fruits as a consequence of the temptation; but they fall to it again in September, when the market is prepared again to pay the growers well for their pains. But although the experimental stage of this interesting investigation has apparently been successfully passed, the test on a commercial scale has yet to be made. The investigators at Cheshunt are finding it extremely difficult to get a large quantity of carbon dioxide into a commercial house and to keep it there. All manner of ingenious methods have been tried, but so far, without success. Nevertheless, there can be no doubt, but that having got so far and so satisfactorily with the experiment, they will devise means to overcome this difficulty. If and when the technical difficulty of supply can be overcome there will be a large field for further research. Thus there is ground for believing that stomata are early risers. It is said that they begin to open before sunrise, are fully opened in the early morning, and close in the early afternoon, before sunset. If that be so, indeed, it may prove that the best time to give them the beneficent gassing would be in the early morning. No less interesting will be the investigation of the maximum growth which is induced when carbon

dioxide is lavished upon the plants. There are indications, however, that what the plant may gain on the swings it may lose on the roundabouts—in other words, that a high concentration of carbon dioxide may, whilst benefiting assimilation by the leaves, depress the activity of the roots. For the authors point out that in some cases the plants pampered with excess of carbon dioxide left behind them in the soil a heavy crop of the fungus *Colletotrichum atramentarium* which promptly attacked the subsequent Tomato crop. These are the risks which must be envisaged by those who undertake to improve on Nature. Nor need such risks deter the experimenter; for if they are found actually to occur, he will have but found another problem on which to exercise his ingenuity.

**The New Year.**—As the date of the present issue falls on New Year's Day, the Proprietors and Staff of *The Gardeners' Chronicle* take advantage of this opportunity to wish their readers, advertisers and contributors the heartiest of good wishes for a Happy and Prosperous New Year.

**Our Almanac.**—The usual *Gardeners' Chronicle* Almanac, giving a list of exhibitions, meetings, annual outings and other events of interest to horticulturists in 1927 will be included with our issue for January 8. Readers will greatly oblige if they will send dates of shows, meetings, etc., fixed for 1927, at their earliest opportunity, in order that the Almanac may be made as complete as possible. As there may be a few secretaries of societies who do not take *The Gardeners' Chronicle* we shall be greatly obliged if our readers will make known to them the fact that we are publishing this list of events.

**Our Supplement Plate.**—With the present issue, we present our readers with a Coloured Supplement Plate representing *Begonia La Patrie*, a hybrid raised by the firm of Messrs. V. Lemoine and Sons, of Nancy, France. On the authority of Mr. J. Coutts, Assistant Curator, Royal Gardens, Kew (see p. 9), we learn that since this Supplement was prepared, *Begonia La Patrie* appears to have been lost to cultivation in this country; we hope this is not so, and that the present references to such a beautiful plant may be the means of restoring it to its rightful place among winter-flowering subjects.

**National Chrysanthemum Society's Floral Committee.**—The N.C.S. Floral Committee will meet at the Royal Horticultural Society's Hall on Monday, January 10, at 3.15 p.m., to consider the merits of any new late-flowering Chrysanthemums that may be submitted.

**Rainfall at La Mortola.**—From Mr. Cecil Hanbury's famous gardens at La Mortola, Ventimiglia, Italy, Mr. S. W. McLeod Braggins writes: "I expect the note in your issue of December 11, regarding November rainfall at Mill Hill—four-and-three-quarter inches—is meant to imply unfavourable conditions, but here, in 'Sunny Italy,' our rainfall record for November was 22½ inches, of which 6.7 inches fell on November 4, during twenty-four hours; add to this five inches for the last week of October and the figures show 27½ inches in thirty-seven days, and all this after 118 days of drought and continuous sunshine. As you published my account of 13° of frost on January 13 last, perhaps a note on the above record may help to dispel the illusion that the Riviera climate is entirely ideal for gardening. On July 6, during our dry, resting season, two inches of rain fell in three hours, causing some superficial damage, and many plants started into growth only to be checked by the long drought. Roses, in particular, have suffered. Owing to the recent rains and hurricanes, great Olive trees have been blown down, and in many parts locally, the terraces (stone walls) have given way.

Will the New Year visitor think of all this when seeing Primulas, Roses, Fuchsias, Narcissus, Aloes, Tecomarias, Bignonias, Ageratum, Linum, Callas, Lavandula, Montanoa, etc., in flower here? Perhaps; but if it happens to be a sunny day I shall hear again: "Oh! but you have such a delightful climate, anything will grow at La Mortola."

**Sugar Beet Development in Scotland.**—Under the auspices of the National Farmers' Union, a conference of the Executives of East, Mid and West Lothian, Roxburgh and Berwickshire branches was held on Wednesday, the 22nd ult. to consider the question of encouraging Sugar Beet cultivation in the southern areas of Scotland. Mr. David Gow, Colinton, who presided, favoured the scheme on the ground that those who had grown the Sugar Beet crop had found it a profitable one, and in the present condition of arable farming it was up to them to increase the acreage and induce the people who were interested to provide a factory south of the Forth. At present the Cupar factory was capable of dealing with the crop from 6,000 acres, but the machinery could be extended to deal with the output of 11,000 acres. He did not think there would be much difficulty in inducing members to cultivate a larger acreage because everyone who had grown a crop was satisfied with the result, and in their own interests he considered it would be quite a profitable proposition. He submitted a motion urging the members to increase their crops of Sugar Beet in order to hasten the time when it might be possible to approach the financial groups to proceed with the erection of a central factory south of the Forth. Mr. J. R. Dale, Sealcliff, thought it was unnecessary to do any propaganda work to get Sugar Beet grown; all they had to do was to let farmers know what results growers had obtained and they would be glad to grow Sugar Beet. Mr. C. H. Beveridge, Livingstone Towers, mentioned that a large proportion of the Beet pulp at Cupar was going to the United States. Mr. Thomas Elder, Haddington, expressed gratitude for the subsidy as it showed what the State could do to help agriculture at the present time, and so long as the subsidy lasted there was no doubt whatever that they could grow Sugar Beet to advantage in Scotland. After further discussion, the motion was adopted unanimously, and it was also resolved to ask the Lothian growers to furnish information from their experience as to the best methods of cultivation, including manurial treatment.

**Disease of the Bracken.**—At a recent meeting of the Scottish Chamber of Agriculture, held at Glasgow, an important announcement was made regarding the discovery of a disease of the Bracken in Ayrshire. A discussion on the subject of this disease was initiated by Mr. Norman Constable, Bute Estate Office, Rothesay, who urged the Chamber to approach the Board of Agriculture with a view to helping the hill farmer whose land was infested with Bracken. Mr. John McNeilage, who seconded, remarked that Bracken was good for nothing, not even for game or for vermin, and he suggested that grants should be offered on the same basis as drainage. Mr. McGill, Ayr, said that a farmer at Knoweside, Ayrshire, had discovered a disease of the Bracken which had been reported to the Board of Agriculture, and the Department had sent down an expert. Specimens of the affected Bracken had been taken, and it was understood that for the first time a disease of this native Fern had been discovered. Whether this disease could be spread as a means of clearing a hillside of Bracken had yet to be tested, but the authorities were trying it, and they would know more about it by another year. If, he added, they could develop the disease they would be nearer a solution of the problem than by cutting down the Bracken, which was an almost hopeless expedient. A small area might be cut, but where they had large areas studded with stones and rocks, as in Argyllshire, the cutting process was useless. The disease remedy was a subject for research. It was ultimately agreed that the Directors should apply to the Board of Agriculture for grants.

**Mr. John McLaren.**—To few men is the pleasure and privilege given to see the commencement of a great work and to carry on the same for forty unbroken years to maturity. Think of this record having been accomplished in a great American city where "changes are lightsome"! What a tribute to McLaren's genius, and what a tribute to the wisdom of the successive Park Commissioners who maintained the continuity of service. The visitor to-day cannot realise that fifty years ago the thousand acres which form the Golden Gate Park at San Francisco were a wild waste of sands, blown about by every wind. Let the official report of the Park Commissioners for 1924 speak: "In 1887, John McLaren was appointed. This experienced horticulturist and forester brought his indomitable energy, keen judgment, and strong initiative into his difficult task. In completing the work his predecessors had begun he also devised those newer and better plans of development that eventually brought to the present state of perfection a once almost arid wilderness, making of it an unbroken

MR. JOHN McLAREN.

expanse of forest and glen, hillock and glade, gladdened by masses of eternal verdure and bloom from the city to the sea." Mr. W. M. Cuthbertson writes: "Three times I visited this great park, each time having the pleasure of Mr. McLaren's company. Each time I left it I felt how grand had been his triumph in creating a great pleasure—a place of restfulness with nothing garish to disturb or distract. Flower beds are numerous and the subjects well-chosen, but they are set back from the foreground in every case—all a part of the great plan. Nearly two thousand species of trees and shrubs are cultivated in the Park. Very special attention is given to a collection of eight thousand named Rhododendrons. In addition to these named varieties an enormous number of seedlings are coming along. The Geographical Society of America, on one of its expeditions, sent a botanist, who travelled through Burma, across the Himalayas and Tibet, to the borders of China. The 'Rhododendron result' was four hundred parcels of seeds sent to Mr. McLaren. In three or four years' time all the seedlings should flower; I peeped into one glade which was planted with six thousand of them. Mr. McLaren has recently been awarded the Gold Medal of the Massachusetts Horticultural Society, and San Francisco has placed a full-length portrait of him in the Palace of the Legion of Honour. He must be the 'Grand Old Man' of American Horticulture. Though verging on eighty, his eye is not dimmed nor his natural force abated; he is looking forward with zest to the development of a new

park of five hundred acres which had just been secured, and taking an interest in a new boulevard which is to extend westward for twenty miles along the shore of the Pacific Ocean! Mr. McLaren is a Scotsman, having been born at Bannockburn, in 1846."

**R.H.S. of Ireland Spring Show.**—The Spring exhibition of the Royal Horticultural Society of Ireland will be held on April 5 and 6. An additional class for Violets has been added to the Schedule, and Mrs. Hum Bland, of Abbeylax, has presented a Silver Challenge Bowl for competition in this class. The exhibition will be held in the Covered Court, Earlsfort Terrace, Dublin, by kind permission of the Earl of Iveagh.

**November Rainfall in West Dorsetshire.**—Mr. Dick Rintoul, Melbury House Gardens, Dorchester, informs us that the rainfall experienced at Bartley (see p. 503, December 25, Vol. LXXX) in November last was exceeded in many gardens in West Dorsetshire. In Sir Henry Peto's garden at Cheddington Court, 11.51 inches were registered; Mr. Trotman, Beaminstor, came second, with 11.44 inches; Mr. Debenham, Clarvilles Urston, and Col. Kitson, Netherbury, each registered 11.11 inches; 11.06 inches was the November record for the Melbury Gardens, while other gardens recorded 10.5 and 10.42 inches. The Melbury records for rainfall in July, August and September were 1.82, 1.25 and .80 inches, respectively.

**Seeds and Tubers for Exchange at Swansea.**—In connection with its Educational Garden at Singleton Park, the County Borough of Swansea has issued a lengthy list of seeds, tubers, etc., available for exchange with other similar establishments. The list is in double column on three foolscap folios, and contains about four hundred species and varieties of plants; copies may be obtained by similar establishments on application to Mr. D. Bliss, Parks Superintendent, Parks Office, Prospect Place, Swansea.

**Horticultural Journal's Jubilee.**—With the December number of the Austrian journal *Illustrierte Flora*, that paper celebrates its fiftieth anniversary; and what is more remarkable still, during all that period there has been but one editor, Oekonomierat Otto Pfeiffer, who thus celebrates his own jubilee at the same time. The paper has seen many ups and downs, but it has a large circle of readers who are very pleased to see it enter upon its second fifty-years' period.

**Veitch Memorial Medal Awards.**—Gold Veitch Memorial Medals have been awarded by the Council of the Royal Horticultural Society to Mr. George Forrest, V.M.H., for his explorations and plant introductions; to Mr. James Hudson, V.M.H., for general services to horticulture; to Rev. G. H. Engleheart, V.M.H., for his work on Daffodils; and to Mr. H. B. May, V.M.H., for general services to horticulture. The Silver Veitch Memorial Medal and £25 has been awarded to Mr. W. Camp, late foreman to Messrs. T. Rivers and Son, a clever exponent of the orchard-house cultivation of fruit trees; and a Silver Veitch Memorial Medal and £25 to Miss Matilda Smith, for her botanical draughtsmanship, especially in connection with the *Botanical Magazine*. The Council of the R.H.S. has offered a Silver and a Bronze Veitch Memorial Medal to be awarded by the deputation of the Council on the occasion of the centenary show of the Société Nationale d'Horticulture de France; and also a medal to be awarded to the best exhibit of Irises by an amateur at the Iris Society's show on June 2.

**Legacies to Gardeners.**—The late Mr. Frank Bruce Howden, of Red Cliff, Paignton, who died on September 4, left his gardener, Mr. Walter Frank Bradford, £100, a freehold house at Paignton, and his shed at The Harbour, Paignton, with all his tools and its contents; also £100 to his wife, Mary Bradford, and £50 to their son, Morris Frank Bradford.—The late Mr. Harold

Lansdowne, Beale, of Findon End, near Saffron Walden, left his gardener, Mr. William Parish, £210, if still in his service. We are pleased to note that, while making only two personal bequests, the late Miss Alice Ann Pilkington, of Laneside House, Accrington, left £500 to her gardener; the residue of an estate of about £40,000 will benefit various Lancashire charities.

**New Victoria Medallists.**—The Council of the Royal Horticultural Society has awarded the Victoria Medal of Honour in Horticulture to Mr. H. G. Alexander, Orchid-grower and raiser to the late Sir George Holford, Westonbirt, Tetbury, Gloucestershire; Mr. R. L. Harrow, Curator of the Royal Botanic Garden, Edinburgh; Mr. Chas. R. Musgrave, Hascombe Place, Godalming, Treasurer of the Royal Horticultural Society 1922-24, for several years a member of the Council and now Chairman of the Housing Committee which is concerned with the building of the new hall; Mr. W. W. Pettigrew, Superintendent of the Manchester Corporation's Public Parks and Gardens, and formerly Superintendent of the Cardiff Parks; Professor Fred. V. Theobald, M.A., one of the greatest authorities on injurious insects and the author of many useful books, including *The Plant Lice or Aphididae of Great Britain*, of which the first volume has been published; Mr. W. E. Wallace, Eaton Bray, Dunstable, one of the pioneers in this country of the commercial cultivation of perpetual-flowering Carnations and a raiser of many novelties; and to Mr. Alfred Watkins, founder of the firm of Messrs. Watkins and Simpson, wholesale seedsmen, Drury Lane, London, E.C. We offer our congratulations to all these gentlemen, to whom the Medal will be presented on the occasion of the Society's Annual Meeting, Tuesday, February 8, at 3 p.m.

**Royal Gardeners' Orphan Fund.**—The Annual General Meeting of subscribers to the Royal Gardeners' Orphan Fund will be held at Simpson's Restaurant, Strand, London, on Wednesday, February 16 next, at 3 p.m. The principal business to be transacted will be the receipt of the Committee's Report and the Statement of Accounts for the past year; the election of officers for the ensuing year and the election of approved orphan children to the benefits of the Fund. We would remind our readers that there still remains time for any additional nominations. The Fund grants allowances of 5s. weekly to the orphan children, under the age of fifteen years, of gardeners, managers and foremen in nurseries, seed houses, public and market gardens. Nomination forms may be obtained from the Secretary, 19, Bedford Chambers, Covent Garden, London, W.C.2, from whom information concerning the Fund may be obtained.

**Loder Rhododendron Cup.**—This Cup was presented to the Royal Horticultural Society by Mr. Gerald W. G. Loder in memory of his brother, the late Sir Edmund Loder. It is awarded once only in seven years, by five judges, three of whom are appointed by the Royal Horticultural Society and two by the Rhododendron Society. Rhododendron enthusiasts will learn with pleasure that the Cup has been awarded to Lionel de Rothschild, Esq., Exbury, Southampton, "for the work he has done in furthering all movements concerned with the introduction and cultivation of Rhododendrons."

**Devon Orchards.**—At a Conference held at Exeter on the 17th ult., to consider the production and supply of young Apple trees for cider orchards, Mr. D. Manning, County Horticultural Superintendent of Devonshire, stated there were 11,000 acres of orchards in Devon that were practically unproductive, and that it would require 20,000 trees a year for twenty years to put the Devon orchards in order. Professor P. B. Barker, of the National Fruit and Cider Institute, Bristol University, said there was need for a considerable extension of the planting of new orchards in the county, and that the orchard position in the west of England was, generally speaking, very bad. Another speaker

said that there was at the present time a big demand for cider, due partly to its increasing popularity and partly to the high price of beer, and it was to be expected that cider would continue to be a popular drink. Mr. Whiteway offered to give to all farmers selling cider Apples to his firm ten trees for every hundred trees they planted between now and the end of the season. Lord Clinton said a great demand for cider was developing, and there was serious risks of shortage of supplies. The cause of the scarcity was, he said, a limited supply of suitable trees and the insufficient knowledge of owners and occupiers as to the proper management of orchards. The meeting passed a resolution "that this conference realises the necessity for a larger supply of cider Apple

in either of the previous years. It has been awarded for 1926 to Messrs. R. H. Bath, Ltd., Wisbech, for Daffodils.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Tomatoes.*—The Tomato is generally cultivated in noblemen's and gentlemen's gardens; but in cold, late summers it can rarely be got to ripen before the autumn frosts set in, although strong plants are put out by the middle of May, and trained to a south wall. This, at least, is my case, but probably some of your readers can give a hint as to obtaining an early supply. I received three varieties in the shape of seeds late last spring, from a friend who brought them direct from Virginia. They were named the "Pear-shaped," the "Egg-shaped"

FIG. 1.—CHRYSANthemum RUDDIGORE.

National Chrysanthemum Society's First-Class Certificate, November 29, 1926, and Royal Horticultural Society's Award of Merit, November 30, 1926, Colour glowing chestnut. Shown by Messrs. Cragg, Harrison and Cragg.

trees and a greater improvement in the orchard industry, and urges owners and occupiers in the county to support the efforts of this conference in that direction."

**Cory Cup for the best New Hardy Plant of 1926.**—The Cory Cup, awarded by the Council of the Royal Horticultural Society for the best new hardy plant of garden origin shown to the Society in the course of the year, has been awarded for the year 1926 to Mr. F. Howard, California, for *Crindonna Memoria-Corsii*. This plant was described and illustrated in *The Gardeners' Chronicle*, January 15, 1921.

**The Lawrence Medal.**—The Lawrence Medal was instituted in 1906 to celebrate the late Sir Trevor Lawrence's twenty-one years' tenure of the office of President of the Royal Horticultural Society. It is in gold; only one medal is awarded annually, and never to the recipient

and the "Large Red," all red sorts, the last-mentioned being the best. All of them possessed a fine, smooth skin, without the furrow common to the old sort, and I should prefer the large red to the old kind. It would probably not grow quite so large, but it has a much nicer appearance. Although later in being sown and planted out than the old sort, they beat it in earlier ripening, thereby confirming the well-known axiom in vegetable physiology, that plants habituated to early excitement will flower and fruit sooner than those on which no such treatment has been practised. Perhaps this disposition is more inherent in plants than seeds. Seeds from warmer climates are, however, to be preferred; for in them early and well-matured habits, for centuries, would not be destroyed for two or three years. This is a point, therefore, to which nurserymen should attend, *W. Brown, Merevale, Gard. Chron.*, January 3, 1852.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Forewords.**—The cultivation of Orchids has improved considerably during recent years, and their requirements are better understood; yet in large and varied collections there are always some plants which do not grow satisfactorily, and not always from want of care on the part of the cultivator. The only way to success is by careful observation and an intelligent study of each plant's individuality and requirements. Even when the best possible conditions are provided, some districts are more favourable for certain plants than others; and even some plants grow better in a certain position in the house than in another. It is not absolutely essential to have a separate division for each section of Orchids. The only structures really necessary are the East Indian, or the hottest house; the Cattleya or intermediate house; the Mexican house, and the cool or Odontoglossum house, and these will accommodate all the Orchids in cultivation under glass.

**Temperatures.**—The respective temperatures by night for this and the next three months

should be as follow: East Indian house, 60° to 65°; Cattleya house, 58° to 60°; Mexican house about 55°; cool house, 45° to 50°. In very severe weather these figures may be allowed to fall one or two degrees, provided cool conditions are not continued for too long. Orchids are, as a general rule, sensitive to fluctuations of temperature, and

they will not long continue in good health if they are subjected to extremes of atmospheric warmth.

**Details of Cultivation.**—The essential details in the cultivation of Orchids are, firstly, a buoyant, healthy atmosphere in each division; secondly, to apply pure, soft water to the different plants with discretion; thirdly, to repot each plant at its proper season, that is, when it is making, or about to make, new roots, and fourthly, to use the best potting material available. Extremes of temperature, etc., should be guarded against; for example, a very warm, dry atmosphere, and a low, cold, damp one are both harmful. During a period of cold weather the atmosphere of the houses should be kept considerably drier than usual, and less water afforded the plants, as a cold, wet compost would cause the roots to decay. If the general cleansing of the houses and their occupants has not already been accomplished, it should be completed so soon as possible. It is advisable to cleanse every plant, washing it thoroughly with an insecticide, as at this season the different insect pests of Orchids are easily eradicated. The leaves and pseudo-bulbs of the majority of the plants are fully matured, and the cleansing operations may be carried out with little risk of injury to the plants. When the weather is open, it is advisable to obtain a stock of the various fibres, peat and Sphagnum moss, so that when the busy potting season arrives there will be no delay in securing the materials.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Ground Operations.**—The New Year begun, all arrears of trenching or digging should be proceeded with at once, as much will be gained by the weather pulverising and sweetening

the soil. Whenever possible, I strongly advocate trenching, which results in better drainage on heavy land, and is a greater resistance by the crops against drought on light soils, besides several other advantages, such as better aerated and warmer soil, and freedom for root penetration.

Presuming a plan of cropping has been drawn up, the tap-rooted vegetables will have been allotted ground that has not been recently manured, otherwise forked roots will result. These crops will be greatly benefited by a dressing of about four ounces to six ounces of basic slag to the square yard, either spread on the surface or mixed with the soil as it is dug, with burnt garden refuse, and about three ounces to four ounces of kainit to the same area. Kainit not only supplies potash to the soil, it kills many insect pests. Organic manure, for such crops as need it, should be well incorporated with the soil and at good depth, bearing in mind possible periods of drought. At this time of the year, the rougher heavy land is left on the surface, the better will be the tilth later; for this reason ridging is highly advantageous, where circumstances admit of this form of tillage.

**The Seed Order.**—The sending of the seed order should no longer be delayed. When ordering seeds remember that good varieties are no more trouble to grow than inferior ones. It is also wise to study peculiarities of varieties with regard to soil and district. For instance, it is useless to order the longest-growing varieties of tap-rooted vegetables where only a very shallow soil exists, unless boring special stations for each plant is resorted to.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Figs.**—Pot Figs which were placed in a steady bottom-heat at the beginning of the

past month and kept judiciously syringed with tepid water, will now be swelling their point buds, a condition which will justify a little more atmospheric moisture and a somewhat higher temperature on the bright days, which are so prevalent during sharp, frosty weather. The rise in temperature should, nevertheless, be slight, and only the best time to syringe the trees is about noon, when the little ventilation afforded must be

discontinued, not so much to raise the temperature, as to secure a moist, genial atmosphere favourable to the development of the young leaves and the swelling of the fruits. When this stage is reached the trees will make rapid progress, especially if the arrangement of the pots favours frequent turning and renovation of the fermenting materials. If thoroughly potted, as early forcing Figs in pots should be, it is more than probable the space for top-dressing and watering will be limited, but liberal feeding being so important to success, this difficulty may be obviated by placing a band of zinc or turf, about three inches deep, just within the rim of the pots. Figs are such gross feeders and so liable to cast their finest and most forward fruits that the roots should be encouraged to find their way into the sods of turf on which the pots are standing. The temperature may range from 50° to 55° at night, a little more or less, according to the outside atmosphere; it is better to err on the safe side than force the trees unduly at this stage, especially at night.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Sweet Cherries.**—The planting of Sweet Cherries is best done early in the autumn, but this operation may be continued until March with every prospect of success. The soil in which the trees are planted requires to be well-drained;

a sweet, fertile loam, mixed with plenty of old mortar and a little wood ash is suitable to this fruit. Bone-meal and, if available, thoroughly decayed manure from the farm-yard should be dug into the ground. When the soil has settled mark out the positions which

the trees are to occupy alongside a wall with a west aspect, and excavate the holes to the depth of two-and-a-half feet. Each station should form the outline of a half-circle five feet in diameter. At the bottom of the hole put a layer, fully six-inches deep, of broken bricks, over which place turves grass-side downwards, or strawy manure, in order to prevent the fine soil from getting into the drainage and clogging it. In planting the roots use prepared soil, making it somewhat firm as the work proceeds. Select young, healthy trees for planting, and defer pruning them until a later date. Good varieties will be found in Early Rivers, Elton Heart, Kentish Bigarreau, Bigarreau Napoleon, Bigarreau Schrecken, Waterloo, Circassian and May Duke.

**Morello Cherries.**—These fruit trees are usually trained on north walls, and as pruning and training the branches are very cold operations in mid-winter, they are best done so soon as the trees have shed their leaves. Assuming that the work has been deferred, endeavour to complete it on all favourable occasions. Large trees, if well balanced, need not be detached entirely from the walls, but the old shreds and ties should be examined carefully and removed if found to be tight and injuring the bark. Do not allow the young branches and fruiting shoots to become crowded. Train in good, sturdy shoots at intervals all over the trees, both for fruiting and replacing older branches that may have to be cut out entirely. Young trees should be removed from the wall

and the new shoots pruned and regulated. Train the branches at equal distances apart, allow ample room in the ties for the bark to swell, and be very careful not to damage the bark when driving in the nails. Young trees from the nursery should be planted in good soil mixed with plenty of lime rubble. Defer the pruning and nailing of the trees to a later date; when these operations are decided on, keep the centre of the tree open. Central growth should never be encouraged to develop when laying the foundation of a young, fan-shaped tree.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Broomfield Hall, Hertfordshire.

**Introductory Remarks.**—Where the cleansing of plant houses and their occupants have not received attention, the work should be completed forthwith, for plants thrive best when growing in sweet, clean conditions. Certain plants may have failed during the past year and failures are often due to circumstances which the grower can more or less control, therefore, it behoves all to review the results of the past year and find out where mistakes have been made.

**Perpetual Carnations.**—Plants propagated last month are ready for placing singly in small pots filled with light, sandy soil, which should not be made too firm by ramming at this stage. Stand the young plants in a low house on a

moderately damp bottom; in such conditions the roots will require very little water until they become more active. The day temperature of the house should be as near 55° as possible, with as much top air as the outside conditions will allow; the temperature may fall to 50°

at night. Continue to propagate these plants to provide successional batches to those already potted. Cuttings will soon take root if placed in propagating frames in the temperature named above; remove the frames entirely every morning for a short time to allow the condensed moisture to escape. Some growers favour rooting the cuttings in sand only, but I prefer to root them in equal parts of soil and sand.

**Flowering Plants.**—The top ventilators of houses in which plants are in bloom should be opened both night and day, and unless the weather conditions prove very severe, they should never be closed tightly. Do not maintain high temperatures by the use of an excessive amount of fire-heat, for this would result in weakened growths and blooms that lack substance. A night temperature of 50° is suitable to plants that are flowering, but on mild nights this amount of warmth may be exceeded to the benefit of the plants; on the other hand, allow the temperature to drop a few degrees on cold nights rather than use too much fire heat. Concentrated manures should be used sparingly at this date, but the amount may be increased towards the end of the present month, with the lengthening days. Late batches of Calceolarias, Schizanthuses, Cinerarias, Clarkias, and other annuals that are growing in small pots may now be placed in larger receptacles for it is not advisable to allow the roots of any of these plants to become starved. These annuals will succeed in good, ordinary soil, and when they have filled their receptacle with roots, they may be fed with liquid farm manure, on frequent occasions.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Bedding Plans.**—Although the bedding-out season seems far off at present, it is wise at this time to consider bedding schemes that were

settled on when the past season's display was at its best, for then was the proper time to take note of unsatisfactory arrangements, as well as of those that proved most pleasing. An examination of perennial plants, such as Pelargoniums and Calceolarias that were propagated last autumn,

should be made, and if there is a shortage of stock most of the plants may be readily increased by means of cuttings inserted at this period of the year. Where formal bedding schemes have to be carried out, it is of the utmost importance to have the required number of plants, as the variety is often limited by the taste of the owner. Where a formal garden does not exist but, may be, a series of more or less isolated beds, the same trouble does not arise, for any failure may be readily rectified by substituting some plant that is readily raised from seeds during the beginning of the year. There are many such subjects, and they are increasingly popular for furnishing beds during the summer because they obviate the trouble and expense of finding accommodation for them during the winter. Many half-hardy or even hardy annuals, such as *Nemesias*, *Salpiglossis* and *Dimorphotheca aurantiaca*, may be used for this purpose. Where a display by these annuals will not last out the season, it may be arranged to replace them with early flowering *Chrysanthemums* or *China Asters*, both of which may be grown in the reserve garden for the purpose; with care, they will transplant readily even when coming into flower.

**Antirrhinums.**—There are so many beautiful varieties of *Antirrhinums* that complete bedding schemes may be arranged with them solely, and for this purpose the intermediate varieties are most suitable, although the dwarf varieties have their value for small beds and as edgings to beds. If the seeds are obtained from a reliable source the varieties will come practically true to colour, and as each variety has a distinct leaf character it is easy to detect a stray rogue in the seedling stage.

**Begonias.**—*Begonias* of the tuberous-rooted section may also be easily raised from seeds and the plants bedded out in their first season. The fibrous-rooted *Begonias* belonging to the *semperflorens* section deserve to be far more generally used for summer bedding for they are easily raised from seeds, which, if of a good strain, will give plants true to name; if a strong rogue appears it is easily detected in the seedling stage. These *Begonias* have the merit of being indifferent to average weather conditions, for rain or shine, they continue blooming until cold and frost finish them off. They may be used alone or associated with light, elegant foliage plants. A few of the best varieties are *Primadonna*, *Pink Profusion*, *Bonfire* and *Glory of Erfurt*.

**Protection.**—As a rule the coldest weather of the year occurs early in the New Year, and if not done already, it is wise to arrange for suitable material to be available for protecting tender plants, either in the open or trained on walls, as slight protection may be the means of saving a valuable or interesting plant. Protection

from the sun when the plant is frozen is of the utmost importance; whatever protecting material is used, it is important that it should remain dry for so long as possible, and also be permeable to light and air. Material that lies close and wet and excludes air does more harm than good. It is also important that it can readily be removed from the plant or plants when not actually required.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Forewords.**—I would like to acknowledge the kindly criticisms and encouraging commendations received during the past year from readers living far apart, which shows how widely and carefully *The Gardeners' Chronicle* is read, and while endeavouring to put down in writing my own methods, it is only natural to expect that these may sometimes differ from those adopted by others. There is more than one method of assuring success in gardening, and it is always well to keep an open and receptive mind. The ramifications of horticulture are so extensive that even the most ardent student realises his limitations, and the most experienced have had to confess that the longer they live there is still more to learn.

**Perpetual Carnations.**—These plants may be propagated successfully over several months of the

year, but cuttings inserted now will have all the advantages of the gradually lengthening days, and where cuttings are available these should be inserted forthwith. In selecting cuttings of Perpetual Carnations choose those of medium growth, rejecting any that are too

thick and fleshy as well as those that are very slender. Make the cuttings either by severing the stem immediately below a joint with a sharp knife or by making them into pipings by snapping the stem in two at a suitable joint. This last method is quite as successful as the other in experienced hands, as the grower seems almost to know by instinct which is the best joint to snap across, leaving the piping at a suitable size. Insert the cuttings firmly in sandy soil in pots, boxes or propagating cases, according to requirements, and water the soil to cause it to settle. Root the cuttings in a steady bottom-heat of 65°.

**The Seed Order.**—Seedsmen's catalogues are being delivered by nearly every post, and profit as well as pleasure may be gained by a careful perusal of these publications. Plant novelties are usually given great prominence, and while advising that some of the more promising should be given a trial, it is always advisable to rely on sorts that have proved reliable in the past. Another point worthy of note to northern gardeners is that while some of these novelties may be worth growing in the south they may not prove hardy enough to enable them to be grown successfully farther north. The best method of gaining experience in the matter of fresh subjects is to visit gardens in the same county.

**Box Edgings.**—If the Box plants have been growing on the same site for many years some of the soil may be removed and richer soil from the vegetable quarters substituted. This may give a new lease of life to the plants.

## THE GREY GARDEN.

The grey garden is a most restful and charming part of the garden in summer, and although at mid-winter many of its earlier charms have departed, it remains just as fascinating, and, in a way, even more attractive, because all outdoor floral colour schemes have vanished, and those plants which have glaucous, blue or grey foliage are brought into more prominence.

If the border is backed by a hedge it adds wealth to the colour scheme, if this is of a grey or bluish hue, and an excellent subject for this purpose is *Cupressus Lawsoniana Triomphe de Boskoop*. If there is no definite hedge, specimens of this Conifer may be used to extend the background in an informal way, together with *C. L. Fletcheri*, *Juniperus pachyphloea elegans* and *Picea pungens glauca*, all of which are good subjects for winter effect.

*Yuccas* are also suitable for inclusion in the grey garden, for their slightly glaucescent foliage contrasts pleasingly with the lighter coloured subjects. *Phlomis fruticosa* makes a bold shrub with tomentose foliage, and large groups of *Lavender*, *Rue* and *Rosemary* give variety in shades of colour, while *Santolina incana* is a strikingly beautiful plant in winter, its finely-cut, almost white foliage being prominent from a great distance.

Amongst dwarfier growing subjects may be mentioned the *Pinks*, most of which form dense masses of fresh blue foliage which remains effective all the winter; *Raoulia australis*, which makes a carpet of delightful grey foliage, particularly if it is given a few stones to creep over; *Veronica pimeleoides*, a dwarf, spreading shrub with good, ever-grey foliage; and *Stachys lanata*, which retains its greenness well into the winter but loses its lustre towards spring. *A. P. C.*

## ALPINE GARDEN.

### GLOBULARIA INCANESCENTS.

SEVERAL of the smaller *Globularias* are charming rock garden or moraine plants, and it is unfortunate that they do not appear to succeed in some rock gardens. The species under notice, *Globularia incanescens*, has proved a difficult plant with many, but it will succeed in a moraine.

A healthy plant of *G. incanescens*, in flower, in June, is so pretty that one is apt to linger over it and admire its close carpet of tiny leaves and the wonderfully large, globular, blue flower heads.

This species only grows about four inches high. Where a moraine is not available a well-drained, gritty pocket of light soil in the rock garden may suit it.

### BAHIA LANATA.

Of the score or more known species of *Bahia*, *B. lanata* is the only one that appears to be in cultivation. It is also known as *Eriophyllum caespitosum*, under which name I first grew it many years ago. It is a native of North America and reputedly hardy with us. Its foliage, however, is subject to much injury in excessively wet winters, and it is occasionally lost through this cause unless protected from overhead wet at that season. This is easily afforded by means of a sheet of glass, or even a thin board or slate, raised about six inches above the plant. A small specimen is of little effect, but a large one is of considerable beauty, and will give a succession of flowers for months. The blooms are yellow and harmonise exceedingly well with the grey or silvery foliage.

It is a distinct-looking plant, with flowers of a bright golden yellow, adaptable for planting either in the front of the border or in the rock garden, for it is of rather procumbent habit. It grows best in a sunny place and a light, dry soil.

*B. lanata* is easily raised from seeds, and may also be increased by division and cuttings.

### POTENTILLA HOPWOODIANA.

SOME of the older *Potentillas*, not now much seen, are quite satisfactory plants, and have much beauty to commend them. They do not, it is true, equal such varieties as *Gibson's Scarlet*, but they have much charm.

*P. nepalensis* var. *minor* (syn. *Tonguei*) is one of the recognised favourites for rock gardens, but is not too often seen. Still more seldom met with nowadays is *P. Hopwoodiana*, a taller plant than *P. nepalensis* minor and attaining about a foot in stature. It is a ch ice, hardy plant and suitable for the flower border or the rockery. It will grow well in any good garden loam and may be increased by division of good-sized plants. This *Potentilla* has pretty, creamy flowers, with salmon-pink veins, and a distinct eye of deep crimson. *S. Arnott*.

### MORISIA HYPOGAEA.

THIS delightful, little, yellow-flowering plant may be grown without difficulty in a variety of places in the rock garden where there is a good depth of light, sandy soil. Apart from its showy blossoms it forms pleasing and attractive rosettes of evergreen, serrated leaves. *Morisia hypogaea* is readily increased by root cuttings. The simplest method to adopt is to lift an established plant, remove its thicker roots, cut them into lengths, and root them in pure sand in a warm frame or propagating pit. The root-cuttings should be kept syringed and grown in a close atmosphere until they have made sufficient top growth to need potting. Propagation may also be effected by leaf-cuttings. *J. T. H., Wisley*.

### DAPHNE RUPESTRIS.

Of all flowering shrubs suitable for the rock garden, *Daphne rupestris*—or as it is seldom, though more correctly, called, *D. petraea*—is one of the smallest, the rarest, and the most beautiful. It is a purely saxatile species, existing only in limestone cliffs in a very limited area high up in the mountains in the neighbourhood of the *Largo di Garda*. It has twice been my good fortune to visit *Daphne rupestris* in its native cliffs, once with the late Reginald Farrer, and then a few years later with my wife. On the latter occasion the plant was in full flower and was one of the most wonderful floral sights I have ever seen. With great difficulty one could get to the base of the cliffs where it grew, then had to creep and crawl, and hew from the hard limestone a plant here and a scrap there, whilst always a few yards above one, yet quite out of reach, the *Daphne* began to be plentiful, and as one looked further and higher up those stark and terrible cliffs, the plant abounded in the most amazing profusion. Every crack in the rocks seemed to be packed with rose-pink, waxy blossom, pouring its heavy, heady fragrance down to the luckless collectors below.

For many years Farrer possessed a famous plant of *Daphne rupestris* which came annually to the old Temple Show, where it never failed to cause the specialists to "gasp and stretch their eyes." It was the most wonderful specimen in cultivation, without a doubt. One could not steal it, for in London it was always shadowed by a private detective in the shape of a nursery foreman or a garden boy. Nor could one buy it. A firm offer of £150 was said to have been refused for it, and I myself offered Farrer £200 for it—which caused a temporary coldness, for he was sensitive to chaff. This specimen was about as big as one's two fists: there on "Rocca Longa" were rock crevices packed with it in streaks and ribbons yards long, and it went soaring up those cliffs to the clouds in hundreds of feet of utterly impregnable temptation and tantalisation. Whilst we were there, the memorable occasion was made yet more memorable first by Farrer turning up with a companion, and then Monsieur Correvo. We had come up over night and slept on the floor of a leaky stable near a collection of cowherds' huts an hour or so below the *Daphne* Cliffs, whilst Farrer and Correvo had arrived by opposite routes that morning, after very early starts. On our first visit, Farrer and I did

the whole climb in one day, starting somewhere about 5 a.m., and by going hard all day, with only a break here and there to collect, and to bite a biscuit, we got in at about 9.15 p.m., and that is about as big a day's outing in the Alps as anyone can want!

As to *Daphne rupestris* in my rock garden, it may be rare and expensive, and a slow-grower, but it is a sure grower and a sure flowerer, especially when grafted. I have had plants on their own roots, fine clumps which I collected as undamaged specimens and then established, but, personally, I have never had any luck with them. They never grew very much and they never flowered with any enthusiasm. Grafted plants, on the other hand, grow steadily, they cover themselves with buds, and another themselves with flowers with perfect regularity. There are two specimens in particular which I planted in rock gardens which I made in pre-war days, one in Hertfordshire and one in Yorkshire, which have grown into superb specimens, larger than Farrer's world-famous, old pot plant, which, by the way, he planted out on his rock garden and it died, and the gardener at Ingleborough still shows me the fatal spot whenever I visit the garden. Until recently there was a fine little forest of *Daphne rupestris* on the rock garden at Kew, a dozen or so grafted plants which came originally from me, and for years they grew prodigiously and flowered profusely.

One hint I would like to give as to grafted plants of *D. rupestris*, and that is that in their first year or two they are apt to throw out suckers from the stock. These suckers should be removed with a sharp knife, and if this is done, the stock soon settles down to its legitimate business of supporting the scion and gives up these foolish attempts at self-expression. The suckers are quite easy to discover on account of their larger, longer, pale green leaves, which are quite distinct from the small dark, hard leaves of *D. rupestris*.

Needless to say, this choice dwarf shrub should be given a place in the rock garden where it will not be overgrown by coarse neighbours. A narrow space among the larger rocks will give it the protection from invasion that it needs, though it requires, of course, a deep root-run. It is not fussy as to soil—good, lightish loam will suit it, or limestone scree, and a sunny position; it is a convenience to have it placed so that one may enjoy its fragrance without either climbing or grovelling. It is one of those plants to which one instinctively wants to put one's nose when it is in flower. It looks as though it smells good—and it does.

Some years ago, that good alpinist, Mr. R. Tucker, collected a superb form of *Daphne rupestris* with flowers almost double the size of the type, a superb thing which has been called *D. r. grandiflora*. The flowers of ordinary *rupestris* are themselves surprisingly big for the size of the plant. They blot out everything else, leaves, stems and branches, when fully-expanded, yet in *grandiflora*—well, I can only say that the plant is well and truly named *grandiflora* without a shadow of exaggeration.

Farrer, by the by, collected on that day when we all went to "Rocca Longa" a plant which he took to be a hybrid between *D. rupestris* and *D. striata*. He wrote a description of this interesting find—maybe in *The Gardeners' Chronicle*—but I never saw the plant, nor do I know if it still exists. The companion who was with Farrer at the time told me a year or so later that he had it in his garden, but, unfortunately, I lost touch with him. If this note should come his way I trust he will make known the ultimate fate of the hybrid. Like so many other things which are small and rare and beautiful, *Daphne rupestris* is unfortunately expensive to buy. Nor do I see any prospect of its ever becoming cheap. To come within sight of the cliffs where it dwells entails a glorious expedition, but to put it mildly, a fatiguing one, whilst the cliffs themselves are heart-breaking. To anyone but a first class coward, like myself, they might easily be neck-breaking. The mere thought of them sets me wondering, in fact, if *Daphne rupestris* is not, perhaps, catalogued too low in value! *Clarence Elliott, Stevenage*.

## TREES AND SHRUBS.

## BILLARDIERA LONGIFLORA.

RECENT remarks by Sir Herbert Maxwell (*Gard. Chron.*, p. 432, November 27, 1926), indicated the attractiveness of *Billardiera longiflora* in autumn, when carrying a crop of its violet-blue, grooved fruits. This led to some correspondence, and Sir Herbert kindly forwarded a few growths and fruits (Fig. 2) of this Tasmanian climbing plant.

Introduced well over one hundred years ago, *Billardiera longiflora* may, according to Mr. Bean in *Trees and Shrubs Hardy in the British Isles*, "only be grown out-of-doors in the milder parts of Great Britain. The finest plants I have seen are in the garden of Sir John Ross, of Bladensburg, at Rostrevor, Ireland, and in that of Mr. Osgood H. Mackenzie, at Inverewe, in the county of Ross. Here it flowers freely in July and is then very pretty, but its greatest beauty comes in October and November when the fruits acquire their charming colour. The fruits contain abundant seed, which germinates readily."

The illustration in *Bot. Mag.*, t. 1507 (in 1812), shows the twining habit, narrow leaves and pale yellow, pendant flowers, as well as one of the fruits, and in the text accompanying the illustration the writer remarks "Native of Van Dieman's Island. Plants raised from seeds ripened in this country will most probably be easily naturalised to our climate. Introduced by Messrs. Loddiges and Sons. Flowers from July to August and ripens fruits in the latter month and September. Propagated by cuttings and by seed."

In the milder parts of the country *Billardiera longiflora* is deserving of cultivation where a free-growing climber may be accommodated, and where plants of attractive appearance in late autumn are especially desirable. *C.*

EUPATORIUM WEINMANNIANUM  
OUT-OF-DOORS.

THIS plant is generally grown in a greenhouse but, here, and in other mild parts of the country, it should be given a trial in the open. Our garden is on the borders of Gloucestershire, close to the River Wye, and this *Eupatorium* has succeeded out-of-doors without any protection, and each year the plants are a mass of flower, while at the present time the heads of seeds are quite attractive.

For at least ten years the plants have occupied their present station, and although they bloom profusely annually, they do not grow so freely as in Cornwall, where I have seen splendid bushes some six feet in height.

The white flowers are produced in somewhat dense corymbs in August and September. Sometime during the winter a little pruning may be done, but in most instances the removal of the flower heads, with an inch or two of growth, will suffice.

The plant can be propagated from cuttings made from the young shoots, and they will form roots at almost any time of the year in sandy soil. During the summer and autumn they will root freely in a cold frame.

*E. Weinmannianum* (or more correctly *E. micranthum*) is a native of South America, whence it was introduced in 1867. T. W. B.

## CISTUS.

THIS genus is closely allied to *Helianthemum* and where the conditions are suitable for the one it will generally be found possible to grow both the Rock and the Sun Roses. The home of the *Cistus* is the Mediterranean regions, therefore, in our duller skies, the plants should be grown in the driest and sunniest places possible.

The individual flowers are of short duration, lasting only a few hours during the earlier part of the day, and they have generally fallen by mid-afternoon, but such a constant succession is maintained that each sunny morning sees a brilliant display which is carried on for about two months. Unfortunately, all the varieties are not hardy and quite a number will succumb even in moderately severe winters. They are plants that are easy to propagate and have the advantage of being rapid growers, therefore it

is advisable to grow a few young plants under glass to take the place of any that have failed during the winter.

Propagation is effected by seeds or cuttings. Seeds are produced freely by some species, but the most of the hybrids have to be raised from cuttings, which root freely if inserted towards the end of summer in a cold frame, under a bell-glass in the open, or in a propagating pit furnished with a little bottom-heat.

As *Cistus*es do not transplant well from the open ground, it is advisable to pot them on when rooted, and keep them growing in pots until they are transferred to their permanent places.

The ideal position for growing *Cistus*es is in full exposure to the sun, in a place where they are sheltered from winds, in warm, well-drained, sandy soil. They seldom, if ever, suffer from drought when they are well established, and are ideal subjects for covering dry, sunny banks. A covering of dry Bracken or Spruce branches

*C. laurifolius* is a robust species with a more erect habit of growth, sometimes, under favourable conditions, attaining a height of eight feet. The flowers measure two to three inches across and are produced from June onwards. This is probably one of the hardiest species, and is useful for planting near the seashore; fine old plants of this *Cistus* have been growing for years on the bleak coast of Kincardineshire without being damaged.

*C. crispus*, a compact, bushy plant, grows about two feet high, and has rose-red flowers from one inch to two inches in diameter. It is fairly hardy, and will withstand all except the severest winters.

*C. purpureus* is by far the best of its colour, and the largest-flowered of the Rock *Cistus*es. It makes a fine, symmetrical bush from three feet to four feet high and as much through. The flowers are of a reddish purple with a deeper coloured blotch at the base of each petal;

FIG. 2.—FRUITS OF BILLARDIERA LONGIFLORA.

during periods of hard frost will often help to carry the more tender varieties through the winter.

The character of the soil or drainage they are growing in is an important factor in wintering these plants. Those growing in a light, sandy, well-drained medium will come through the winter more successfully than others planted in less ideal positions. It is not advisable to adopt the usual time of planting during November or December, but to defer this until spring; if planted during autumn, and a period of frost sets in, the plants seem to get crippled and never thrive with the same vigour as those that are planted during spring.

*Cistus*es, as a rule, are not long-lived plants, except such species as *C. laurifolius* and *C. cyprius*, therefore it is wise to keep a few young plants in stock to replenish losses. The seven following species and varieties will be found to give a maximum of flower, either as shrubs in the open or with the protection of a wall in the colder districts.

Of the stronger-growing kinds, *C. cyprius* is a vigorous, evergreen shrub, with shining, fragrant gum on the young wood and leaves. The flowers are borne in clusters; they are white with a bright red blotch at the base of each petal.

they are borne in clusters of three. It is a most attractive plant when in flower, but, unfortunately, it is none too hardy, and should have protection during hard frosts. This is said to be a hybrid between *C. villosus* and *C. ladaniferus*.

*C. ladaniferus* is a handsome, evergreen shrub, attaining a height of four feet to six feet, and with erect habit. The young growths are clammy and very sticky. The flowers, which are solitary, are white with a delightful crimson red blotch at the base of each petal.

*Cistus Silver Pink* is a delightful hybrid which should become a very popular garden plant, as it has many good points to recommend it. The colour is a clear pink which few would object to. The habit of carrying its flowers on stiff, upright stalks, the blooms lasting until late in the afternoon, the free-growing, compact, bushy form, and the hardiness of the plant, make it a most desirable variety to grow.

*C. formosus* is rather tender and is apt to be killed during severe winters. It is such a beautiful plant that it is worth the trouble of keeping a few specimens under protection during winter and planting them out in spring on a warm, sunny bank. The bright yellow flowers, with purple-brown blotch near the base of each petal, are most attractive. F. W. G.

## ROSE GARDEN.

## ROSES IN OXFORDSHIRE.

THE photographs I send you (Figs. 3 and 4) show my Rose garden the third year after planting. In 1923 there was not a Rose on the place. The paths were formed and sown down with grass seeds and now provide a good, green carpet. Such paths would not be advisable in all gardens, but I think they give the Roses and all flowers in general a better effect. On both sides of the paths I planted a collection of Roses, edged with *Viola Princess Mary*.

The Rose trained on the support in the foreground of the Rose garden picture (Fig. 3) is *Pax*, a hybrid Musk, with pure white, semi-double flowers that are much admired for the sake of their musk perfume. This is a favourite Rose of mine; it grows too strongly for a bush and not rampant enough for a climber, but when established it gives beautiful sheaves of flowers.

FIG. 3.—THE ROSE GARDEN PATH AT ROSE COTTAGE, KIDLINGTON, OXFORDSHIRE.

This variety was raised by the late Rev. J. H. Pemberton, and is practically perpetual flowering, producing its flowers in large, branching clusters.

On the left hand of *Pax* is *Climbing Liberty*, but unfortunately, the flowers do not show up well; this charming sport of a very popular variety grows very freely with me.

Where the walks cross there are two plants of *Yvonne*, a *Wichuraiana* hybrid sent out in 1921; the flowers are a charming soft shade of pink, deeper in the centre and yellow at the base these are carried in large trusses and are sweetly scented. This variety has won the Cory Cup for the best climbing Rose.

*Paul's Scarlet Climber*, vivid scarlet, I place first on the list of climbing sorts. It carries large trusses of semi-double blooms, and without doubt it is the most effective climber in my garden, growing vigorously and flowering with great profusion.

The second illustration (Fig. 4) shows

*Lady Godiva* by one of the cross paths. This is a very desirable *Wichuraiana* climber with salmon-pink flowers. It is very attractive and a good grower, but not quite so rampant as some of its family. Below this, on the left, is climbing *Ophelia*, quite an acquisition, and when the flowers are half open they are faultless, while the fragrance is wonderful. On the right of this cross path, I have climbing *Gardenia*, *Albéric Barbier* and *Léontine Gervais*, all making marvellous growth and of which I hope to send you photographs another season.

At the present time I am planting the front rows of my Rose borders with a collection of *Polyantha* Roses—*Coral Cluster*, glowing coral; *George Elgar*, yellow; *Jessie*, bright red; *Yvonne Rabier*, white; *Maman Turbat*, shaded peach; and *Rodhatte*, clear cherry-red, and finishing off with variegated *Arabis*—this last, when grown in tufts or as an edging, is very effective. *John Butler, Rose Cottage, The Moors, Kidlington, Oxon.*

## IRIS GARDEN.

## IRIS ORIENTALIS SNOW QUEEN.

ACCORDING to some, *Iris orientalis* is a distinct form of the elegant *I. sibirica*, with larger flowers, broader leaves and one that generally grows about two-and-a-half feet high. It is a very beautiful *Iris*, but it has been somewhat eclipsed in the estimation of growers by the introduction of two varieties, for which, I believe, we were indebted to the late Mr. Peter Barr, who was responsible for their introduction in 1902.

The two varieties in question are *Blue King*, a very handsome *Iris* of good colour, and the subject of this note, *I. orientalis* *Snow Queen*. That the latter is a plant of superior beauty may well be concluded from the fact that it received a First-Class Certificate from the Royal Horticultural Society.

It is of bold, yet graceful habit, and in favour-

able conditions, will attain a height of three feet. Like *I. sibirica* and its other allied forms, *Snow Queen* is a lover of moisture and is finer by the water-side or in a moist border than in ordinary soil. It has large flowers of beautiful ivory-white, with broad falls, and a large sized plant with a number of expanded flowers is truly handsome.

*I. Snow Queen* is absolutely hardy and a marked ornament to any garden. It may be increased by division. Possibly, it may come true from seeds, but my plants have never produced ripe seeds for sowing. Planting may be done in autumn or spring. *S. Arnott.*

## ORCHID NOTES AND GLEANINGS.

## DECIDUOUS CALANTHES.

ALTHOUGH the number of species of *Calanthe* suitable for horticultural purposes is limited, the genus is of especial interest owing to the many beautiful hybrids that supply an uninterrupted succession of flowers throughout the winter.

No warm-house Orchid is more universally cultivated, and probably these plants are grown in more gardens than any other member of this most beautiful family of plants.

The species and hybrids comprising this group should be potted so soon as they commence to grow in early spring. In removing the pseudo-bulbs from the pots the exhausted soil should be shaken out and the old roots left about an inch long to hold them in the new compost. The pseudo-bulbs may be potted singly or otherwise; but in the case of rare varieties and the stronger growers, single pseudo-bulbs, potted separately, give the best results. The pots should be well-drained and the crocks covered carefully to prevent the fine soil washing down into them. A suitable compost is made of two-thirds fibrous loam, from which the fine particles have been removed, and one-third *Osmund* fibre cut into fine portions and mixed with a small quantity of half-decayed Oak leaves and bone-meal, with sufficient sand to render the whole open and porous. The compost should be made moderately firm in the receptacles. Water should be supplied sparingly until the new roots have freely entered the new material, but so soon as active growth has commenced the plants will need liberal supplies of water. When the pots are well-filled with roots, the usual waterings may be supplemented with a little weak liquid manure, but care should be taken that this is not applied at too great a strength, or it may be the means of black spot appearing in the leaves.

As the new pseudo-bulbs approach maturity and the leaves begin to turn yellow, the amount of root-watering should be reduced gradually, until, when the leaves have fallen and the flower scapes appear, only sufficient will be required to keep the flower spikes from drooping. After flowering, water should be withheld altogether and the pseudo-bulbs allowed to become dormant. This is best attained by placing them on a shelf in a dry house where the temperature does not fall below 60°. Many fine stocks of these plants have been ruined by placing them in out-of-way places in a low temperature.

These *Calanthes* are natives of very hot regions, and require the temperature of the warmest house. During their stage of active growth they should be grown in a light, airy position; they may also be cultivated successfully in a Cucumber or Melon house.

The varieties of *C. vestita* are so well known that there is no need to refer to them here; also *C. Bryan*, *C. Veitchii* and *C. Bella*; but the varieties of *C. Sedenii* are not known to the same extent, although the lovely, pure white *C. S. Harrisii* is incomparable, whilst *C. burfordiense* is a most beautiful deep-coloured variety.

There are numerous other varieties which at the present time are worth acquiring as opportunity occurs, especially where these plants

are grown in quantity to supply flowers during the duldest days of the year.

Such varieties as *C. George*, *C. Kenneth*, *C. Harold* and several others, will add variety even to a select collection. *C. Regnier* and its hybrids flower at a later date than *C. vestita* and its hybrids, thus prolonging the season of flowering well into the spring. *J. T. B.*

#### THE STAMPERLAND ORCHIDS.

THE success in Orchid culture achieved by Mr. Robert Paterson, of Stamperland, a residence which occupies a charming situation in the southern outskirts of Glasgow, is an encouraging event in the history of Scottish horticulture. In the short space of four years he has formed a collection that numbers about five thousand plants, representing choice hybrids and a few varieties of *Cypripediums*, *Odontoglossums*, *Cymbidiums*, *Cattleyas* and *Miltonias*, several of which have been distinguished during the past year by awards from the Royal Horticultural Society.

The *Cypripedium* house, containing between four hundred and five hundred plants, is now the centre of attraction. Prominent among those in flower are *C. Golden Sunset* and *C. Golden Wren* in variety, *C. Orbus* and *C. Plutus*, *C. Our Prince* (A.M.), *C. Christmas Cheer* (F.C.C.), and *C. Lucifer* (F.C.C.). Another group includes outstanding specimens in *C. Artific* (A.M.); *C. Sir J. M. Barrie* has a shapely flower with a dark centre and white margin; *C. Maisie* is meritorious, while *C. Odin* and its varieties are numbered among the best. A few plants were still in bud at the time of my visit.

In the adjoining house there are over one thousand specimens of *Odontoglossums*, of which forty or fifty were in flower, but the plants gave promise of plenty of bloom later. Of those flowering, *O. Pyramus* commanded attention with its graceful spike of fourteen wine-coloured flowers. *O. Omega*, dark purple, with blotched lip, was also conspicuous, and part of the staging was occupied by a big batch of seedlings in different stages, from tiny plants up to those of flowering size. There were several *O. crispum* of the Premier type, as also is the variety *Priscilla*, which received an Award of Merit in London. A third house is devoted to *Cymbidiums* in healthy condition. Some of Mr. Paterson's best Orchids are to be found in the fourth house, containing the *Cattleyas* and *Miltonias*. Here the effects of the weather were reflected in several of the blooms, a recent dense fog experienced at Stamperland having done a lot of mischief to the *Cattleya* flowers. Among the outstanding examples, *Cattleya Fabia alba*, *C. labiata*, *Laelio-Cattleya Meuse*, *L.-C. Sargon*, *L.-C. Queen Mary*, and *L.-C. Schröderae* were fine. The *Miltonia* collection is probably the smallest of the lot, but what is lacking in numbers is made up by the quality of the hybrids, several of which have been honoured by the Orchid Committee of the R.H.S. *M. Lycaena* and *M. Lucie*, both Stamperland varieties, were awarded the F.C.C.

The labours of the past and the hopes of the future are centred in the seedling house where hundreds of seedlings in different stages of growth are accommodated. *J. Y.*

#### INDOOR PLANTS.

##### BEGONIA LA PATRIE.

(See Coloured Supplement Plate.)

THIS hybrid Begonia was raised by Messrs. M. V. Lemoine and Sons, Nancy, and was exhibited by them at the meeting of the Royal Horticultural Society, on January 12, 1909. After the Floral Committee, on that occasion, granted it an Award of Merit, there was a notice of the plant, with an illustration, in *The Gardeners' Chronicle* of January 30, 1909, p. 75, Fig. 42. The parentage of this winter-flowering Begonia was given as *B. socotrana* crossed with a variety of *B. Pearcei*, the latter a yellow-flowered Andean species, and the progenitor of the yellow-flowered varieties of the present-day

race of tuberous-rooted Begonias, its beautifully marked foliage being still in evidence in the present-day yellow-flowered varieties.

The seed parent, *B. socotrana*, is, of course, the parent of the two sections of winter-flowering Begonias, which are so important for floral decoration during the winter months, viz., the *Gloire de Lorraine* varieties, the original *Gloire de Lorraine* being also raised by M. V. Lemoine. The other winter-flowering set resulted from crossing *B. socotrana* with varieties of the tuberous-rooted Andean species, the original work being carried out by the late Mr. John Heal when with Messrs. James Veitch and Sons, Chelsea.

*Begonia La Patrie* is, in general appearance, not unlike some of the *Gloire de Lorraine* varieties, being of a somewhat compact habit of growth, with stiff, closely-bunched inflorescences of rose-pink flowers. Although one of the parents, *B. socotrana*, makes resting buds, and the other, *B. Pearcei*, is tuberous-rooted, the hybrid makes neither resting buds nor tuberous roots, in this respect resembling most

quicker results are obtained by means of suitable growth cuttings.

The other section of winter-flowering Begonias resulting from crossing the tuberous-rooted varieties with *B. socotrana* and represented by such fine varieties as *Optima*, *Exquisite*, *Fascination* and many other fine single- and double-flowered varieties, require very careful management when out of flower, as that is the most difficult and critical period of their cultivation.

Every effort should be made to retain their foliage for as long as possible, and to attain this end very careful watering is necessary. On no account should they be given an access of water at the roots, rather keep them on the dry side. It is a great advantage if they can be stood on a solid bed of moisture-holding material, which, if kept damped regularly, and the spaces between the pots syringed, will obviate the need of much watering.

During this period, a temperature of between 50° and 60° is most suitable. With careful management of the plants most of the shoots

FIG. 4.—ROSE LADY GODIVA AT THE ROSE COTTAGE, KIDLINGTON, OXFORDSHIRE

(see p. 8).

of the other winter-flowering varieties; in fact, it closely resembles the *Gloire de Lorraine* group in its general appearance, habit, and cultural requirements, as it is propagated in the same way, either by means of leaf cuttings or young, basal shoots; in short, it should be accorded the same treatment in every way as the *Lorraine* group.

For some reason or other, *Begonia La Patrie* was never largely grown, and at the present time it seems almost to have fallen out of cultivation, which is a great pity, from the scientific as well as the garden standpoint; but as both parents are known and are in cultivation, it should be an easy matter at any time to reproduce the hybrid.

##### WINTER-FLOWERING BEGONIAS.

BEGONIAS of the *Gloire de Lorraine* type will continue to flower for a long time, but if not already done, a number of plants should be set aside for stock. For this purpose they should be partly cut back and be kept somewhat drier at the roots than hitherto. When young basal shoots develop they should be secured for cuttings while about three inches in length; some cultivators contend that the best results are obtained from leaf cuttings; personally, I have never found any difference, and much

and foliage will be retained until they commence to throw up fresh shoots from the base during April. In this way growth should be sufficiently advanced for securing cuttings during May and June. In any case the plants should never be dried off completely as this usually proves fatal, especially with such varieties as *The Gem*, *Ideala* and *Elatior*. At Kew, *Optima* also proves troublesome, although cultivators in the country, where more favourable conditions obtain, find no difficulty with it. With all the varieties it is wise to keep ample stock, as the losses are often heavy, especially with some of the weaker-growing varieties.

##### PENTAS CARNEA.

THIS pretty and useful plant was at one time common in gardens but is now seldom seen. It may be had in flower more or less all the year round, but is specially useful during the autumn and winter. It will flower freely in a house having an intermediate temperature. This *Pentas* is easily propagated at almost any time and cuttings will root readily in a warm case. To obtain plants for flowering during the autumn and winter it is best to propagate stock during the spring and stop the plants several times during the growing season to promote a bushy habit. *J. Coult.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA\*

### V.—ON THE NAM TAMAI.

AT the cane suspension bridge, the Nam Tamai is 3,000 feet above sea-level. It is a swift river of considerable size, with many rapids and cascades; yet, after following it up for six days, we were little more than 4,000 feet above sea-level, and the character of the vegetation showed no great change; we were still in the jungle. However, the temperature of the Nam Tamai was only 54°, very much less than that of the Mali, so that there was no doubt as to its being snow- and ice-fed; we had only to follow it right to its head to be amongst the snow mountains.

Coolies having assembled in force at the bridge, we pushed on next day (April 30, 1926), without a halt, continuing for three days. We were still in an almost flowerless forest. True, a cream-flowered *Acacia* was in full bloom, also one or two species of *Oak*, and an *Elaeocarpus*, a dainty thing, whose fringed, white flowers are the resort of a multitude of insects. The parts of the flower are very cunningly fitted together. At the base of each petal are two small pockets, formed by an infolding of the margins. The bottom of each pocket fits over a protuberance of the disc, and each sepal has a double groove, into which the pocket on either side of it is tucked. The disc secretes honey into the pockets, and there insects probe for it; the flowers hang downwards in order to protect the pollen from rain. The whole contrivance is admirable, and on a fine, sunny day one can hear the hum of insects round an *Elaeocarpus* in bloom yards away, bees and beetles being the most constant visitors.

Very beautiful was a species of *Oak* now breaking, with plumes of wine-purple foliage, through which the light shone redly. Alder now appeared for the first time, and after a few days, we saw, high up on the topmost ridges, a few straggling Conifers. Palms, except the climbing *Calamus*, which was abundant up to 5,000 feet, and a rare *Sago Palm*, had ceased to exist; but there were leafy seas of *Bamboo*, while *Tree Ferns*, climbing *Aroids*, *Zingiberaceae*, giant *Musa*, and other hall-marks of the Indo-Malayan flora were still plentiful. Yet one

noticed a difference. There were no *Dipterocarpaceae* here, for instance, and the number of species of *Ficus* had dwindled appreciably.

Orchids, both epiphytic and terrestrial, were numerous, and of many different genera, and I was able to make a good collection; of the first 170 species of plants collected after leaving Fort Hertz, twenty-seven were Orchids. But there were a far greater number out of flower.

The forest came right down to the rocks in the river bed, leaving only a narrow belt in dispute between high and low water marks; and it was interesting to note how the forest gradually encroached as the river ploughed its bed deeper. First of all, Moss and Lichen formed a veneer over the boulders which, though they might be submerged for a time, were not severely hammered by the force of the spate. A little higher up, where there was less danger, a species of Fern, tussocks of grass and colonies of *Equisetum* had gained a footing, and, profiting by their example and presence, here, too, a few annual

it rained and rained in April, when it should have been fine to enable the people to burn the jungle and plant the spring crops. And then, at the end of April, when the situation was becoming desperate, came a week of fine, hot weather; the new clearings were made, the crops sown, and the situation was saved.

As we approached the Seinghku-Adung confluence at the top of the Nam Tamai, wayside flowers began to appear in the shade of the forest or in old clearings now covered with secondary growth. In the forest was a white-flowered *Anemone*, in the open the path was rimmed with misty, blue clouds of *Forget-me-not*, and purple *Geranium*, while damp ground was sheeted with a butter-yellow *Ranunculus*, and colonies of small, perky *Mimulus*. In the thickets *Luculia gratissima* was in fruit, and in places *Bracken* appeared. These, together with one or two species of *Arisaema*, were all the indication we had as yet of approach to a more temperate climate; and though at the end of the third day's march we could see a snow-clad ridge

FIG. 5.—WESTERN IRRAWADDY AND JUNGLE.

flowering plants, and *Compositae*, and also a species of *Valeriana*, were established; most of these had flowered and seeded before the risk of inundation threatened. Then came an herbaceous border of *Impatiens*, followed by a narrow belt of shrubs—*Rhododendron indicum* sometimes, a curious species of *Ficus*, and a *Pyrus*, with clumps of *Spiraea*; and back of that the jungle. All this in a belt perhaps twenty feet wide and a dozen feet in depth.

The valley of the Nam Tamai is, for this country, fairly well populated. Nevertheless, we had to halt on May 3, to collect a fresh relay of coolies, and the halt was prolonged a second day before we got the full number. We were then able to do another two marches before the coolies' food gave out and they had to return. There had been a serious famine during the previous two years, and many of the villages were deserted, either because the inhabitants had all died of disease, or because they had fled into the jungle to live on roots and berries.

This famine had been, if not entirely caused by, at least greatly aggravated by the flowering of the *Bamboos*, which had supported millions of rats. When the *Bamboo* seeds were all eaten, the rats migrated into the clearings and devoured the crops, while the people starved until the next harvest. They can carry on under such appalling conditions for one year; they are used to it. To a certain extent they can carry on, though dying off by tens and twenties, especially old people and young children, through a second year of famine, living in the jungle; but if there is a famine this year, God help them. At one time it looked as though there would be, for

wedged into the upper end of the valley, where the river split, that was still a long way off. Massive thickets of *Bamboo* and two thousand feet of heavy jungle separated us from a few clipped *Fir* trees, which peeped down at us from the more windy ridges, outposts of the alpine forest. They rose up there against the sky-line as though jealously guarding the approaches, ready to give warning of our assault upon their self-determined territory; but they only lured us on the more eagerly.

*Rhododendron dendricola* was a common epiphytic shrub all up the valley. Down here it was over, but at 5,000 feet it was still in fine bloom. I cannot quite reconcile this Nam Tamai plant with true *R. dendricola*, described from a specimen collected in the Htawgaw Hills, two hundred miles away; it seems to be a local variety. The differences, however, are slight and technical. The Nam Tamai variety often has a distinct pink flush, especially in bud, due to broad bands of purple on the corolla ribs showing through the white inside; the corolla is only slightly lepidote at the base. We had to halt on May 3 and 4, and again on the 7th. Three times we crossed the river by flimsy cane bridges, finishing up on the right bank. The weather during the first half of May was very unsettled, and a lot of rain fell at a time when it is still fine and dry in Burma proper; but we were spared the intolerable hot weather of Burma in May, and in any case it hardly ever is fine for any length of time at the headwaters of the Irrawaddy.

There was a certain amount of cultivation up the Nam Tamai valley. The jungle is cut down—though big trees are often left standing

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9, and November 20, 1926.

Supplement to The GARDENERS' CHRONICLE

BEGONIA LA PATRIE

for lack of means to fell them—and after a few days of fine weather, set on fire. Then the charred wood is cleared away, the crops (Maize, Colocasia and Buckwheat chiefly) sown, and after the harvest the clearing is abandoned, being already overgrown with weeds. These are gradually replaced by thickets of grass, Rubus, Alder, and many other plants, many of the original trees not destroyed by fire, sending up suckers; and in a few years a dense growth, more difficult to penetrate than the virgin jungle, covers the ground. Many years must elapse before the same ground can be cleared and sown a second time, and so villages are rarely permanent, and the jungle tribes become semi-nomadic.

The forest trees in the valley are tall and unbranched below, just smooth white pillars expanding into a ball of green at the summit. There are no plank-buttress roots at the base, and they are not greatly burdened with epiphytes. Very different are the trees high up on the flanks and ridges of the mountains, which live in the perpetual mist and drizzle. Here they are neither tall nor stately, but twisted and gnarled, and of much greater girth, upheld below by plank-buttress roots and upholding in turn another world of vegetation—epiphytic Orchids, Melastomaceae, Ericaceae (Rhododendron, Agapetes, Gaultheria, etc.), Gesneraceae (Aeschynanthus, etc.), climbing Aroids and large Ferns. And as we travelled north-westwards, ascending slowly, it was refreshing to note the spring colours of the more deciduous forest replacing the dead monochrome of the jungle; shrill yellows, which set one's teeth on edge, bold bottle greens, furtive greens with a hint of yellow, sage greens, purples, bronze and red, an ever changing kaleidoscope of colour.

After the fifth march up the Nam Tamai, the path, which so far had been quite good, degenerated into the usual jungle track, and on the sixth day (May 8), proceeding sometimes over the boulders in the river bed, sometimes swallowed up in the forest above, we presently reached the junction of the Seinghku and Adung rivers, the former from the north-west, the latter from a little east of north. Crossing the violent

## CONTRACTS FOR THE PURCHASE OF LAND.

It is often desired to make a contract either for the purchase or sale of a small piece of land without calling upon the professional assistance of a solicitor, and when the bargain has been made, the parties to it will probably want to

induced by any fraud or mistake, and these rules apply whether the contract is for the sale of land or goods.

In order that the contract may be enforceable it will have to be in writing and a copy made so that both buyer and seller may each have a copy signed by the other. Since it is to be in writing, what must the writing contain? It must contain a proper description of the buyer and the seller, a description of the piece of land

FIG. 7.—NORTH EAST FRONTIER OF BURMA.

get it settled at once without waiting for their respective solicitors to deal with the matter, or if one of them wishes his solicitor to see the contract, then he will want to know how to

which has been sold and the price that has been paid for it.

Moreover, if any special stipulations, such as obligations to fence or the granting of a right of way, have been agreed upon between the parties, these should be set out in the contract, otherwise the party who is to benefit by them may have great difficulty in enforcing them.

If one of the parties does not wish to consider the contract as a "final" contract, but intends his solicitor to settle it for him, then he should insist on the addition of some such expression as: "subject to a proper contract being prepared by the seller's (or buyer's) solicitor," to prevent the conclusion of a complete contract. This is very necessary as a safeguard.

Although it is usually essential that a contract for the sale of land should be evidenced by writing, this must be qualified to a certain extent, for on some occasions a verbal contract can be enforced by one of the parties. Thus, if one party refuses to abide by a verbal contract, if the other can prove that he was prevented from obtaining the necessary written evidence by the fraud of the first party he should be able to enforce the contract although he has no written evidence of it; or again, if in consequence of a verbal contract one of the parties has gone into possession of the land, then the verbal contract will be binding. So that if B has verbally agreed to sell some land and premises to A, and A goes into actual possession and improves the property, it would be inequitable for B to refuse to implement his bargain on the ground that a sufficient written memorandum was lacking. The Courts are, therefore, given power to compel him to carry out any such bargain.

The taking possession must, of course, demonstrate that some contract relating to the land has been made, for if a man is already in possession of the land as a tenant, he cannot rely on the fact to prove an agreement to sell the property; his possession is explained by the fact that he is there as a tenant, and there is no necessity to show that a contract for sale has been made to explain why he is in possession of the land. *Harold Sharman.*

FIG. 6.—ADUNG RIVER ON THE UPPER NAM TAMAI.

Seinghku by a very rickety cane bridge, we camped on a knoll in the angle between the two rivers. We were now 4,000 feet above sea-level, but there was no cessation of the jungle; and though we were at the very foot of the mountains which rose above us for thousands of feet on every side, I soon found that they were far too steep to climb, even had they not been clothed with impenetrable jungle. As for the rivers, they were both roaring cataracts. *F. Kingdon Ward.*

word it, so that it can be submitted for his approval. If the parties wish to do this, then how should they set about making such a contract?

We will assume that the sale is the result of private bargaining, for if the sale has taken place at a Public Auction, the parties can generally obtain professional assistance on the spot. In the first place, of course, there must be a clear offer and acceptance, and the consent of either party must be freely given and not

## MESEMBRYANTHEMUM.

(Continued from p. 229, Vol. LXXX).

As a delay has been caused in the continuation of my account of this group by the want of sunshine experienced this year, delaying the flowering of some new species that I wish to include under the genus *Glottiphyllum*, which follows next in the sequence, and which are only now flowering, I take the opportunity to publish below a key to some new genera, and descriptions of new species belonging to the genera *Conophytum*, *Lithops*, etc., already dealt with. Most of them have not yet flowered in this country, but as the size, shape, surface and coloration of the growths are the principal characters that distinguish many of these peculiar plants, and as names for them are wanted in South Africa also for many that will soon be distributed by Monsieur Fr. De Laet, I have deemed it advisable not to wait until they all flower before describing them, proposing to publish descriptions of their flowers at a future time; meanwhile the names can be used.

Also I would like to correct an error in the key to the genera published in *The Gardeners' Chronicle*, 1925, vol. LXXVIII, p. 433, where the genus *Conicosia* (see under the coupled paragraphs Nos. 27 and 28) is stated to have alternate leaves. Haworth stated this to be the case. After having examined living adult plants, I came to the same conclusion, and therefore accepted this view for the purpose of my key, but having this year raised a few plants of this very distinct genus from seeds and watched their development, I find to my surprise that the leaves are really all opposite, although by a peculiar mode of growth as the plant develops they point all ways and form a large, dense tuft in which they appear to be arranged alternately and are very long.

The following is a key to some new genera, founded partly upon new discoveries and partly upon old species that I had either not seen or of which I had only incomplete material when making my previous key, and although I then believed them to belong to new genera, I preferred to wait until actual material was available for examination before founding genera upon them, hence their omission from the previous key. Numbers are added to indicate their approximate position in the sequence adopted, and I have also indicated the type species of each genus. Full descriptions will follow as each genus is dealt with in its sequence.

## KEY TO NEW GENERA.

1. Annuals; leaves opposite, flat; flowers solitary; pedicels 2-6 inches long; calyx unequally 5-lobed; petals free, slender, passing into stamens; capsule expanding its valves when wetted; placentas on the floor of the cells.

Perennials; leaves opposite, not flat; flowers solitary; pedicels under 2 inches long or flowers sessile; calyx 5-6 lobed; petals free; capsule expanding or separating its valves when wetted; placentas on the floor of the outer wall of the cells.

2. Leaves petiolate, with a lanceolate or ovate flat or concave blade, glabrous; stigmas 10, filiform; ovary inferior, 10-celled; capsule with 10 valves and cells; expanding-keels of the valves central, more or less contiguous at the upper part and separated at the base or subparallel throughout, entirely adnate without free tips or wings; cells without cell-wings or tubercles; seeds globose, smooth.

Species 2, *A. Pillansii*, N. E. Br., the type of the genus, and *A. helianthoides*, N. E. Br. (*Mesembryanthemum helianthoides*, Ait.)

27b *Apatesia*.

Leaves linear to narrowly oblanceolate, pubescent; stigmas 12-14; ovary nearly or quite superior, 12-14 celled; capsule with 12-14 valves and cells; expanding keels of the valves arising quite at the margins of the valves and inflexed so that their edges are nearly or quite con-

tiguous, and ending in free diverging awns; cells narrow, roofed for half their length, without a tubercle at the opening; seeds flattened, D-shaped, smooth.

Species one, *M. Candollii*, N. E. Br. (*Mesembryanthemum Candollii*, Haw.)

27a *Macrocaulon*.

3. Capsule small and thin, separating into 5 valves or parts with the cell-partitions adhering to the centre of each part and separating from the central axis so that the ellipsoidal, smooth seeds are liberated; a very small, tufted plant; leaves semiterete or subtrigonus; stamens about 25, in one series, erect; stigmas 5, subulate; ovary partly superior, 5-celled; placentas at the base of the outer wall of the cells.

The only species is *E. alpina* N. E. Br.

39a *Ectotropis*.

FIG. 8.—A DEFILE ON THE NAM TISANG. (see p. 10).

Capsules not thin and provided with expanding-keels to their valves, which expand when wetted; stamens numerous in many series.

4. Stamens erect and evident.

Stamens concealed under a mass of inflexed petals and stamens; a shrub; leaves with the acute edges and keel finely lacerate-toothed; flower 2 inches in diameter, purple; stigmas 10, very small; ovary 10-celled; valves of the capsule ascending-spreading when expanded and not closing after once expanding, their expanding-keels diverging and ending in awn-like points; cells roofed with rigid cell-wings, without a tubercle at the opening.

The type of the genus is *S. lacera*, N. E. Br. (*Mesembryanthemum lacernum*, Haw.)

41a *Semnanthe*.

5. Stigmas and cells of the ovary and valves of the capsule 5; dwarf plants forming clumps about 3-3½ inches high; leaves trigonous, tapering to an acute

apex as viewed from the face; with 1-2 small teeth on the keel at the apex; stigmas plumose; ovary inferior; valves of the capsule suberect or somewhat inflexed when wetted, with diverging, expanding-keels ending in awn-like points; cells roofed with rather stiff cell-wings and the opening nearly closed by a large, compressed tubercle.

The type species is *A. bellidiflorus*, N. E. Br. (*Mesembryanthemum bellidiflorum*, Linn.)

34a *Acrodon*.

Stigmas and cells of the ovary and valves of the capsule 8-10

6. Leaves with several slender flexible teeth along the edges and keel, velvety-puberulous to the touch and dotted; calyx 5-lobed; stigmas 9-10, subulate; ovary inferior; valves of the capsule reflexed when expanded, with parallel expanding-keels toothed on their edges and ending in free membranous tips; cells roofed with stiff cell-wings and the opening nearly closed by a large tubercle; seeds compressed-ovoid, smooth.

The only known species is *O. Marlothii*, N. E. Br.

40b *Odontophorus*.

Leaves quite entire and smooth at the edges and keel, glabrous, not dotted.

7. Shrubby plant 1-2 feet high with very distinct internodes.

Plant 3-4 inches high; leaves stout, united for some distance at the basal part, somewhat compressed, bluntly keeled, not dotted; calyx 5-lobed; petals passing into stamens; filaments of the stamens bearded; stigmas 10; capsule very shallow; expanding-keels very broad and closely contiguous, quite covering the basal half of the valves, convex (not acutely keeled) on the top, produced into a small, stiff, obtuse wing at the apex; cells open, without a tubercle; seeds compressed, triangular in outline, smooth.

The type species is *Z. suppositum*, N. E. Br. (*Mesembryanthemum suppositum*, L. Bolus).

39b *Zeuktophyllum*.

8. Erect shrub; leaves but slightly united at the base, not stout; semiterete; flowers at first terminal, later becoming apparently axillary all along the branches; 15 lines in diameter, yellow; calyx 6-lobed; stamens numerous, erect; stigmas 8-9, plumose; ovary inferior, 8-9-celled; placentas on the outer wall of the cells.

The type of this genus is *M. mollis*, N. E. Br. (*Mesembryanthemum molle*, Ait., not of any other author).

40a *Malephora*.

N. E. Brown.

(To be continued).

## NOTE FROM SOUTH AFRICA.

## HARDINESS OF BOUGAINVILLEA GLABRA.

REFERENCE was made in your issue of September 25 last to the hardiness of *Bougainvillea glabra* and *Plumbago capensis*. I was very interested to know that these plants will withstand up to 10° of frost or more when well established.

Here, in the Cape, they are two of our hardiest plants and withstand a great deal of hardship, both from drought and cold winds, as outdoor creepers and hedges respectively. Further north I have seen *Bougainvillea* growing in such towns as Kimberley, where severe frosts are experienced occasionally and where the winters are always very cold.

I can therefore see no reason why both these plants, once they are established, should not survive your winters out-of-doors in a sunny, warm aspect in the south of England. W. Bowles, Rosebank, Cape Province, South Africa.

## A SHORT HISTORY OF SPRAYING MACHINERY IN ENGLAND.

WITH the increasing danger to cultivated plants from the attacks of insect pests and fungous diseases, there has arisen an urgent need for more efficient spraying machinery to deal with them. The French and American phytopathological services have been until comparatively recent years far ahead of the British service in the matter of adopting new remedies and encouraging manufacturers to take up the production of apparatus for the application of wet and dry insecticides and fungicides to plants.

Control methods by means of machinery are of fairly recent date, and it is only during

purpose of applying Bordeaux mixture to vines. An early account of this device is given by Hitt\* in 1758. The author remarks that when caterpillars are seen on wall fruit trees "I have prepared a brine the same as for washing of walls at the time of pruning, and therein dipt a brush or besom and swept the trees all over; this has destroyed many, by beating some off and killing others." Later (p. 122), he suggests that fire engines be used for treating standard trees.

Joseph Paxton†, the famous horticulturist, writing in 1833, describes the preparation of a decoction of Tobacco water and Elder shoots for destroying insects on fruit trees, and informs his readers that "the trees sprinkled with a small hearth-brush for two or three weeks will effectually destroy the insects."

Another early method of applying liquids to plants was to sprinkle them with an insecticide through a watering-can fitted with a fine-rose nozzle. Its use was limited, for it could not be employed usefully except on low-growing plants, although Rogers‡ suggested its use for wall trees and advised a man to stand on a ladder and throw the insecticide on to the trees by means of a fine-rosed watering-pot.

Both the whisk and can methods are extremely wasteful of materials and the next type, that of the syringe, is not much better on account of the poor pressure obtainable, the wastage of material through constant filling and dripping, and the coarseness of the spray due to low pressure and construction of the nozzles. The first type of syringe consisted of a simple plunger working in a tube into which the liquid was drawn by suction. An improvement in the form of a separate intake fitted with a ball valve (Fig. 10) was invented by Read§. It was first exhibited at a meeting of the Royal Horticultural Society on August 7, 1821. When charging the type of syringe previous to Read's invention, the water had to pass through the same small holes by which it was discharged, the weight of the lift being considerable, and the time to charge it unnecessarily long.

Syringes are still in great demand in small gardens for applying various washes to plants, and are in constant use in fruit and ornamental plant houses for spraying water on to the foliage and stems. Improvements have been made so that they are now fitted with fine, medium and coarse nozzles attached to an angle-bend adjustment, and a drip-preventer is provided. The different kinds of syringes in these days are legion, whilst many of the older patterns are described and illustrated in the agricultural journals|| and gardening encyclopaedias¶.

A further advance was made when a continuous supply of liquid was available. This was effected by arranging a separate intake and air chamber which eliminates loss of time in recharging and provides a constant stream of liquid. This took the form of a continuous-spraying syringe, closely allied to which is the Bucket Sprayer (Fig. 11), a much later introduction than many of the larger types of sprayers. Its mechanism consists of a double-acting pump—sometimes fitted with an agitator—for use with a bucket.

Besides syringing plants against the attacks of insects and pathogenic organisms, there are three other methods which have been adopted for a considerable time; they are "dipping," "sponging," and fumigating, all methods in use at the present time. In 1851, there were two types of fumigators on the market, the hand-worked blower and a larger machine mounted on a one-wheeled carriage, the bellows being operated from a chain-drive off the axle.¶, \*\*, ††.

\*\*.

††. *The Gardeners' Chronicle*, April 10, 1851, p. 255.

††. *The Gardeners' Chronicle*, May 17, 1851, p. 319.

A great advance was made when larger machines capable of holding up to fifty gallons of liquid, were placed on the market. The early types closely resemble the modern tank and barrel sprayers. The container, which held from fifteen to fifty gallons of liquid, was made of tin, copper or wood, mounted on a two- or three-wheeled carriage. A double-acting pump and air chamber provides a continuous stream of liquid, which is ejected through nozzles placed at the end of spraying-arms. This machine was originally called a garden engine, and various types are described by Forsyth\*, Mawe and Abercrombie† and McIntosh‡, and illustrated in the agricultural and horticultural journals of the period§.

Besides the tank sprayers, there are several makes of barrel sprayers, fitted with hand-

FIG. 10.—SPRAYING SYRINGE FITTED WITH BALL VALVE.

lever pumps, which are placed on a farm cart and used for spraying both market garden and fruit crops.

The first knapsack sprayers used in this country were introduced from France in 1891. Their introduction was due to Miss Ormerod||, the well-known economic entomologist, who arranged with M. Vermorel to send his "Eclair" Sprayer (Fig. 12) to Messrs. C. Clark and Co., Windsor Chambers, Great St. Helens, E.C., who acted as distributing agents for this machine, the original cost of which was £1 15s. 0d.

Miss Ormerod¶ writing to Dr. J. Fletcher on March 23, 1891, observed: "Last year we did

¶. Wallace R. Eleanor Ormerod; *Autobiography and Correspondence*, 1904, p. 208.

FIG. 9.—WHISK FOR SPRAYING, MADE OF BIRCH OR HEATHER.

the last few years that there has been a great demand for spraying apparatus of all kinds. Spraying machinery may be classified according to the source of power as follows:—(1) Hand Power—Whisks, syringes, powder bellows, bucket sprayers, hand-worked knapsack sprayers, and hand-lever pumps attached to barrels and tanks; (2) Compressed air—Pneumatic sprayers; (3) Traction Pumps—Horse-drawn Potato and Hop sprayers; and (4) Power Sprayers—oil and gas engines of varying horse-power.

In reviewing historically the evolution of spraying machinery in this country it will be found that the earliest and simplest device for applying liquids to the foliage of plants was a whisk made of Heath or Birch twigs (Fig. 9). Lodeman\* mentions this device as being in use in France as late as 1882 for the

\*. Lodeman, *Spraying of Plants*, 1908, pp. 54-57 and 181-224.

not know where to turn for a proper sprayer; now, on the day before yesterday there was to be a 'contest of sprayers' at the Crystal Palace. I think this shows of itself how the matter on insecticide sprayings has come forward."

The policy of *The Gardeners' Chronicle* has always been one of encouragement to the grower, and for many years prior to 1891 it had advocated the necessity of following the lead of other

either on to the upper or lower surfaces of the foliage (Fig. 13). The "booms" are jointed so that the overlapping ends can be raised to allow the machine to enter through a farm gate. Another improvement is the adjustable wheels which can be fixed at various points on the axle.

A great advance was made over the Vermorel knapsack sprayer when the pneumatic or compressed-air machines were introduced. They appeared only a few years before the outbreak of war, and have proved themselves of great value in gardens and small orchards. There are three types—the hand machine, knapsack sprayer, and wheeled machine, capable of holding from two to six pints, two to four

suffer from scarcity of food material if those who are responsible for controlling the ravages of insect pests do not devise even better and more efficient remedial measures and machinery for applying them.

There are two schools in the ranks of economic entomologists; the old school considers that the chemical control of pests will continue to be the most efficient method, while the new school looks to the elimination of injurious species by the use of their parasitic and predaceous enemies. Time alone will show which method is best, but it would appear safe to prophesy that chemical control of pests will hold the field for many years to come.

My acknowledgments are due to Messrs. Cooper, Pegler and Co., Ltd., 24-26, Christopher Street, Finsbury Square, E.C.2, for supplying the photographs of the Eclair sprayer, bucket pumps and traction machine, and to Mr. F. J. Chittenden, Editor of the Royal Horticultural Society's *Journal*, for permission to reproduce the figure of Read's syringe. G. Fox Wilson, R.H.S. Laboratory, Wisley, Surrey.

FIG. 11.—TYPES OF BUCKET SPRAYERS, THE ONE ON THE RIGHT FITTED WITH AN AGITATOR

countries in the matter of pest control. Commenting on the trial of spraying machines at the Crystal Palace in 1891, this journal\* remarks: "After advocating these measures and calling attention to what other countries have done in the matter of insecticides and apparatus for their distribution, it is some satisfaction at last to see the subject practically attended to at home."

Although the "Vermorel" type of sprayer is worked by hand power, there is a chamber fitted either inside or outside the machine in which air is compressed, with the result that a steady supply of liquid is kept up.

In the early types of horse-drawn machines, the liquid gravitated through main pipes on to revolving brushes which spread the liquid over the plants as the carriage proceeded along the rows. A machine, known as the "Strawsonizer" was adaptable to both liquid spraying and dry dusting. It was manufactured by Messrs. Hornsby and Sons, Spittlegate Iron-works, Grantham, in 1890.

In later machines, by means of a lever pump worked from a crank on the axle, the liquid is pumped from the container into spray "booms" and ejected from nozzles fitted on adjustable arms which enable the wash to be distributed

gallons and ten to twenty gallons of liquid respectively.

Power sprayers were in use in this country in the latter part of the nineteenth century and have improved steadily until at the present time there are few fruit farms and market gardens which do not possess some type of high-powered spraying outfit.

The latest method of distributing insecticides and fungicides to plants is by means of a low-flying aeroplane. This method has been in use for some years in America\*. The first record of an aeroplane being used for this purpose in Great Britain was in 1922† when a Cherry orchard in Kent was dusted with a proprietary material (Belumnite) against leaf-eating caterpillars.

Growers might be tempted to think that, as at the present time they have nearly reached the goal and, with the extended use of high-powered spraying machinery and aeroplane dusting, the matter of complete pest control is only a matter of time. Such is not the case, however, and the populations of various countries will

## NOTICES OF BOOKS.

### Farrer's Last Journey\*.

So much has been written by Reginald Farrer himself about his Asiatic adventures and so much by other hands that it needed some courage to prepare another book on the same subject, particularly as the ground has been already covered by Farrer's own letters to our columns. Those letters, indeed, provide the material without which this book could hardly have been written, though the author has been privileged to draw on other letters from Farrer to friends.

Had Farrer been spared he would certainly have written at length on his sojourn in the

\* *Farrer's Last Journey*. E. H. M. Cox, Dulau and Co., London. 18s. net.

\* *The Gardeners' Chronicle*, March 7, 1891, p. 309.

Burmese Alps, but though the result would doubtless have been as entertaining to his admirers as *The Eaves of the World* and *The Rainbow Bridge*, gardeners and botanists would not expect to learn very much more of material importance than is to be found in Farrer's published letters.

Happily, however, the author has been able to do more than present his readers with extracts from Farrer's letters arranged in orderly sequence and with appropriate comments. As Farrer's companion during the first of the two seasons he spent in Upper Burma in 1919-1920, Mr. Cox is able to present the same picture seen by different eyes, and, though there are occasional echoes of the Farrerian style, he presents it without that spate of racy prattle, as Farrer himself calls it, which poured unchecked from his pen. In the result, the first part of the book is as interesting an account of a year's plant hunting in a comparatively limited area as anyone could wish to read. It has the inestimable advantage, too, of coming from the pen of a man who knows his plants at first hand, and has since kept many of them under observation. Though the story is all about plants, trees and shrubs, the country and the conditions in which they grow, it never degenerates into the arid catalogue of species and varieties with which before now some collectors have been content to cover page after page. On the other hand, though camp is continually pitched and repitched, it is never Xenophonic.

Here and there in these six chapters on the Hpimaw country, gardeners will find sage reflections and sage counsel on the vexed question of the management of Asiatic plants in this country. In regard to the Asiatic section of *Primula*, for instance, we read that: "In fact, whatever people may say to the contrary, many of the Asiatic *Primulas* are among the most difficult plants we possess; some of the *Nivalis* and *Muscarioides*, and all the *Sonchifolia*, *Carolinella*, *Petiolaria*, *Soldanelloides*, *Bella* and *Dryadifolia* sections are not among plants for ordinary gardens. Some day we may learn the trick of cultivating them. So far, the only road to even moderate success is to eschew pot culture. Every seed should be saved and most of them should be treated as annuals."

Again, on the subject of that much misunderstood word, *hardiness*, in relation to plants: "I cannot let this opportunity pass of again pointing out the fact that there is no rule of thumb by which we can gauge the hardiness of plants from this corner of Asia. I dare say that this *Rhododendron*,\* if it is ever introduced, is not hardy, even in Cornwall, and yet up on the Chawchi its flowers were not only out, but over, within a hundred or two feet of what was the snowline at that time of year. If ever one could imagine that a plant was hardy, it would be in a case like this. Hardiness is not a question of the extremes that a plant can stand, but of the small fluctuations which it has to experience; that and two other factors that most gardeners are often inclined to overlook, the actinic value of the light and the humidity of the atmosphere."

Only those who have been through the mill themselves can have any conception of the plant collector's life, especially on the roof of the world. Apart from personal danger, happily non-existent in Burma, but very much the reverse in Tibet and Western China, a collector's life is a hard one. "There is no courier or hall porter at the Ritz to map out your day's sightseeing for you; you have to do all the staff work yourself. Routes and dates have to be planned weeks or months ahead. Specimens must be seen to, seeds cleaned, and the field notes written; and above all, you are in a constant tremble of fear in case you have missed anything important. A minor horror is the spectre in front of you that all the flowers that you have toiled up mountains to collect have already been introduced from elsewhere, and may be blooming in a Tooting garden. Of all the fears of the collector these are the most insidious. Once they appear like a speck on your mind they grow and grow until they entirely fill your horizon. It is often impossible

\**R. hylaeum*.

to tell if a plant is new or not until your specimens have been critically examined in a herbarium at home. At the first thrill of discovery you are sure that your find is far more marvellous than anything ever seen before; then doubt slowly creeps in, and you will see either a real or an imaginary resemblance to something you have seen elsewhere, and this will remain as a fixture in your mind for months."

In Upper Burma Farrer was faced by a climate and a country as different from that of Kansu as chalk is from cheese. It is the difference between an old and highly civilised people and a backwater without tradition. In his own words: "There is no rainy season here, which means that it merely pours solidly for twenty-three hours out of every twenty-four, from June to November. The chief drawback of the country, apart from its preposterous climate and its utter lack of art, antiquity and architecture, is its almost universal vesture of forest and copse." From time to time his almost inexhaustible patience gave out, as in a letter to Sir Isaac Bayley Balfour. "Do you fully, I wonder, realise the limitations of travel here? In China and Tibet abundant 'roads' and inexhaustible supplies; here, in what is mysteriously called Upper Burma, a country with no supplies whatever, a country buried in jungle

but his loyalty to his fellow adventurers at home was never in question, and having put his hand to it, his boundless enthusiasm and indomitable pluck were proof against conditions which would have broken the spirit of a man of lighter calibre, and eventually wore down his own physical resistance. His detachment and his wonderful capacity for living within himself and amusing himself must have stood him in good stead in the exceptionally rainy season of 1921, when, except for his native servants, alone in his leaky shack at Nyitadi—"nothing but vacillating screens of bamboo"—he was never dry and seldom saw the sun. The strain would have sapped a vitality stronger than Farrer's, and probably made the final collapse more or less inevitable.

Of the actual end, all is conjecture, except that it was mercifully only a matter of days; but Mr. Cox makes it clear that Farrer's trustworthy native servants did all they could for him. Beyond that they gave him decent burial, in a clearing above the fort at the military post of Kong-lo-bum. Himself a child of the Pennines, the hills always had an inexhaustible attraction for Farrer, and, glad as his many friends would have been to have had it otherwise, it is not unfitting that he should rest within sight of the eaves of the world.

FIG. 13.—HORSE-DRAWN SPRAYING MACHINE FITTED WITH SPRAY BOOMS.

(see p. 14).

of an almost Malayan density." Again, "It is too absolutely lacking in human interest or emotional appeal of any sort. The colours, of course, are beyond words; but . . . I could not make much even out of colours unless some interest were also aroused. China gave one odds and ends of buildings, temples and so on to stimulate and appeal . . ." In this country we have lately had a taste of what seemed excessive rain, and know how disconcerting and depressing it can be to those who have to carry on their avocations whatever the weather. But in a country where the rain is measured by inches per day for months on end, it must be almost beyond human endurance. "I painted flowers," Farrer wrote, "and I wrote and all was very pleasant, though everything came to pieces in the wet, and blankets, chairs, clothes, were all continually in a reek, and one's breath steamed on the raw, corroding damp as if all one's high thoughts were indeed only hot air . . ." Can we wonder that many of Farrer's specimens reached the Edinburgh Herbarium in a hopeless condition. Shortly before that he had written: "I am paying a long, heavy price, though, for the thrill of this year. Solitude far too long; up in a place too big for one's pettiness is bad; one has to expand or be squashed. I wonder if I shall emerge a saint or a philosopher—or a gibbering lunatic."

Had Farrer known beforehand just what was in front of him in Upper Burma, it is probable that he would have made the journey,

Keen cultivators of plants will derive much interest from the author's chapter (Appendix A) on the hardiness of plants from Upper Burma, and will be largely in agreement with him that the majority of Upper Burmese plants are beyond the powers of the cleverest outdoor gardeners in Britain.

In Appendix B, too, amateurs of *Rhododendron* will find Miss Helen Maxwell's notes on the species found or introduced by Farrer invaluable. Primroses were always nearest Farrer's heart, and until he went to Upper Burma his interest in the *Rhododendron* genus was barely lukewarm; indeed, as his readers know, he had expressed himself of old in characteristic fashion about the genus. But Hpimaw opened his eyes to the incomparable beauty of *Rhododendron*, and incidentally opened the flood gates of his descriptive powers, as in his account of *R. asperatum* (p. 191). Had he lived, *Rhododendron* species must have run Primroses close in his affections.

Of the forty-five *Rhododendrons* found by Farrer and himself, Mr. Cox rates fifteen—a fair proportion—as of quality, and of those found and introduced by Farrer, *R. aiolosalpinx* is possible the pick. Farrer found it on the Chimili pass at eleven to twelve thousand feet, in 1919 (No. 926).

The many fine photographs of the country will help stay-at-home readers to a realisation of its almost illimitable vastness, and something of the difficulties the explorers had to contend with. They are worthy of more

careful attachment to the pages than the publishers have seen fit to give them. There is but an occasional misprint, and the index is scrappy.

Farrer's place in botany and horticulture is not easy to define. His reputation as a collector of Asiatic plants rests on the results of his exploration of Southern Kansu in 1914-1915, and the journey which is the subject of this book. Had he lived to continue his work he would doubtless have gone down to posterity as a great collector; and as it is, notwithstanding the ill-luck which dogged him, his three years of adventure have enriched gardens with several fine things. Their number would have increased had his Kansu journey not coincided with the opening years of the war, when but little attention could be given to the voluminous material he sent home. Comparison between Farrer and other collectors is valueless, for he had only been in Asia three years when he died, and he was unlike anyone. His unbounded enthusiasm often led him astray in his judgments of plants from the gardener's point of view, and those judgments were often revised: but his swans were seldom geese; and though, in a sense, he never grew up, he brought all the resources of a whimsical personality, a cultivated and alert mind, and a memory keen beyond the ordinary to bear on the ruling passion of his life. Gardeners throughout the world are in his debt.

## FRUIT GARDEN.

### PRUNING HARDY FRUITS.

For many years it has been the practice of most gardeners to carry out the main operations of pruning hardy fruits at any convenient time through the winter. It is true, of course, that some pruning has been done at other periods, e.g., most advocates of the super-pruning system carry out what is called summer-pruning, but even they prune in winter by again shortening the growths during the dormant season.

As to the respective merits of the various methods of pruning—hard pruning, light pruning, spur pruning and extension pruning—I do not propose to discuss, but I would like to consider the question: When is the right time to cut a tree? I know that the answer from some growers will be: never. If, however, the question is considered, even the most extreme advocate of the natural methods of growing trees must admit that some pruning is necessary. From the bud or graft stage, the tree has to be shaped, and after the main outline of the tree has been laid down, the head has to be kept reasonably thin. The question then, is just as important to those who prune lightly as to those who closely spur-prune.

The plan of winter pruning has been followed in the past for at least three reasons: 1, The main work of pruning can be done more conveniently during the comparatively slack winter period than at any other time; 2, In the past growers have paid a great deal of attention to the bleeding of cut plant tissue, and have been inclined to think that the safest time to cut plant tissue was during the dormant season; 3, Many have been in the habit of somewhat confusing the drying of cut plant tissue with the healing of the same. It would, perhaps, not be out of place here to examine these three reasons in a little more detail.

1. Undoubtedly it is a great help to most growers to get the main work of pruning done at a slack period. It would appear, too, that the work can be done fairly effectively during the winter, but I often wonder if growers do not deceive themselves over this. Quite apart from the fact that woody stems may, or may not, heal during the winter, is the fact that some of the pruning generally done in winter could be done better during the growing season. To make the point clearer, let me take the case of an established tree—of Apple, Pear or Plum. No matter to which school (hard pruners or light pruners) we belong, I think that all are agreed that the first essential is the removal of diseased wood. Most of the dead wood in fruit trees is due to fungous attack, and many fungi do not produce spores until the

tissue in which they are living has been killed. To remove the diseased parts so soon as possible is the best method of control we have for certain troublesome diseases, and yet this work is often badly done. The diseased and dead wood could at least be better seen during the growing season than during the dormant season, e.g., apart from silver-leaf, the most common disease among Plums is possibly wither-tip, *Sclerotinia cinerea*, formerly called *Monilia cinerea*.

The most effective control for this disease is the removal of diseased portions, which is perfectly easy to do during summer, and exceedingly difficult to do in winter, except on very small trees. To cut out some of the diseased shoots and leave in some is not the best of practice. It may be due to the season, but the fact remains that some Plum growers whose trees missed a crop last season, took advantage of not having a crop to harvest, to cut the wither-tip out. This season they have had a good crop of Plums and the wither-tip appears to be much reduced. I feel certain that although it is very convenient to get most of the pruning done in winter, the practice is responsible for much diseased wood being left in. This is unfortunate, because the removal of diseased wood is perhaps the only detail of the practice of pruning on which all are agreed.

2. Many gardeners have come to the conclusion that it is dangerous to cut trees except in the dormant season. This idea is probably based on the fact that damage and sometimes death results when certain plants are pruned in the spring. Because vines and certain Conifers bleed very badly when cut in spring, most gardeners think that spring pruning is wrong, and that the only safe time to cut woody tissue is at the time when the cuts do not show any sign of moisture at the surface, namely, winter. Some gardeners have noticed that if woody tissue is cut when it is in full leaf bleeding does not take place to any extent and that a callus forms very quickly. However, many still cling to the ruling that winter is the only time to cut woody tissues.

3. Very closely linked up with the above question of bleeding is the confusion that has, and in the majority of minds still exists, between the drying of cut plant tissue and the healing of the same. Priestley and Woffenden\* have shown that when Potato tubers are cut into two sets and the cut surfaces exposed to air and sunlight, the cut surface does not form a continuous sheet of suberin. If, on the contrary, the cut tubers are kept under conditions where the newly exposed surfaces do not dry quickly, a continuous layer of suberin is formed in a short period.

This is rather in conflict with what many have thought, who have inclined to the view that if cut tubers could be prevented from bleeding, or rather, if the cut surface dried quickly, cut sets healed up and the resulting plants did better when planted, hence the practice of dipping cut Potato sets in lime, soot, dry soil, etc. If the cut surface remained dry, growers have been satisfied that everything was in order; on the other hand, if the cut surface bled a little, they have been afraid that all was not well.

Recent research has shown that these conclusions have no reliable basis. Swarbrick† has shown that certain twigs cut in winter remain open wounds until the following late spring; whereas in twigs cut during late spring and summer the wound healed very quickly and within a very short period became closed, inasmuch that disease organisms failed to enter.

The above three paragraphs may be an attempt to defend the practice of winter pruning; the defence advanced is probably not complete, and many other reasons could no doubt be found as to why most pruning is done in winter. Yet if recent research work be correct, it seems to show that growers have been wrong. To prune fruit trees during winter is to cause as many open wounds as there

are cuts made; disease organisms can enter readily through these wounds and new seats of disease are set up. I am aware that growers have painted large wounds with tar to keep out disease organisms, but Brooks and Moore\* inform us that tar is unsatisfactory, and that something else is better. Brooks and Moore when writing of *Stereum purpureum* state: "At most times of the year infection took place as readily through the gas tar as through unprotected wounds." Even if painting cut surfaces with tar or any other substance did keep out disease, it is only practical to treat the large cuts; all the small wounds must remain untreated. Brooks and Moore show that certain substances do help to keep out the organisms of *Stereum purpureum*, but Swarbrick's work goes to show that the best protection of all is when wounds are made during May, June, July and August, because wounds made during these months plug up very rapidly. This work of Swarbrick seems to explain the statement of Brooks and Moore in the above paper. "It has been found that the fungus can generally infect fresh wounds readily throughout the year, except during June, July and August."

How can growers make the best use of this research work? It appears certain that from the standpoint of plant disease, winter pruning is wrong. If growers can manage to put these new facts into practice they should do something towards making their fruit trees more healthy. There are, of course, practical difficulties to be overcome, e.g., it would be impossible to spur-prune in June and July. It would seem that of the two schools of pruners those who only thin their trees would be best able to make use of this research work. All thinning, apart from the question of labour, could be done just as well during June and July as at any other time. Those who spur-prune are not placed in quite such an easy position; they could carry out their programme of summer pruning as hitherto, but it would seem that the final spurring would be best left until so late as is practical in the following spring. *Somerset.*

### WALL FRUIT TREES.

THE pruning and fastening of fruit trees on walls should now receive attention. Where summer pruning was resorted to earlier in the season, all that remains to be done now is to shorten the growths already cut back to four or five buds, otherwise the spurs they are forming will soon grow long and unsightly; and to reduce the leading shoots to the desired length. This applies to Pear and Apple trees growing against walls, whether they are trained as single cordons or as horizontal or fan-trained specimens, but in the case of Plums a more rational form of pruning is desirable, and this is best performed by removing old, worn-out branches and training in young shoots in their places.

These young shoots may be shortened to about two-thirds of their length if the tips are not properly ripened, and the short side spurs formed on them will, in course of time, produce quantities of flower-buds.

Young trees which have a tendency to grow rapidly should be examined carefully and all ties which are liable to compress the bark removed. The modern methods of wiring garden walls is a great advantage and permits of fastening the shoots speedily and securely. Morello Cherries, which require a great amount of tying each season, may be fastened to lengths of sheep-netting secured to the walls. As the wires cross every four or five inches the shoots may be made secure easily, no matter in which direction they are trained. *H.*

### WINTER SPRAYING.

A quiet day should be chosen to spray fruit trees with one or other of the winter washes now so highly recommended, taking care to observe the instructions given with the various preparations.

The older methods of spraying with caustic soda washes is now being superseded by the newer carbolic specifics, which are said to be very effective in destroying the eggs of aphids.

\* Priestley, J. H. and Woffenden, L. M. The Healing of Wounds in Potato-Tubers and their Propagation by Cut Sets. *Ann. Appl. Biol.*, Vol. X, p. 96-115.

† Swarbrick, T. The Healing of Wounds in Woody Stems. *Jour. of Pomology*, Vol. V, p. 98-114.

\* Brooks, F. T., and Moore, W. C. Silver Leaf Disease. *Jour. of Pomology*, Vol. V, p. 61-97.

etc., without burning of the bark of the trees, which sometimes accompanied the caustic soda treatment. Where fungous diseases are prevalent, such as canker and scab, a thorough spraying with a lime-sulphur wash, just before the buds begin to develop, is one of the best remedies. The spraying may be repeated in a diluted form after the trees are past the flowering stage, with excellent results. Too much emphasis, however, cannot be laid on the fact that very old Lichen-covered and canker-infested fruit trees are better removed and burned, as they form a centre of infection for young, healthy trees which are planted in their vicinity, and it is generally a waste of time and energy to try to cleanse them. A. T. Harrison.

## CULTURAL MEMORANDA.

### PRUNING HARDY SHRUBS.

THE winter pruning of hardy shrubs calls for attention, and with a few exceptions, this should take the form of careful thinning rather than hard pruning.

The various species of *Prunus*, *Pyrus* and, in fact, any deciduous shrubs, the branches of which have become unduly crowded, should be thinned judiciously. Others which are exceeding their allotted space and overcrowding their neighbours, may be shortened back, but in all cases the branches should either be removed entirely or pruned back to a junction or fork; unsightly stumps should on no account be left, for the whole art of this system of pruning is to make it as inconspicuous as possible.

After the pruning is completed all the cut surfaces should be painted with gas tar; this will make the exposed wood waterproof and prevent the entry of fungous spores.

*Syringas*, *Deutzias*, *Philadelphus*, *Diervillas*, etc., are better pruned immediately after flowering, but if this has been neglected, and the bushes have become dense, a light thinning of the older wood will benefit the plants, even if it means the loss of a few flowers.

The pruning of such autumn-flowering shrubs as *Buddleia variabilis*, *Caryopteris Mastacanthus*, the hybrid *Ceanothuses*, and the shrubby *Spiraea japonica*, which are usually pruned fairly hard, should be deferred for a few weeks or they may be induced to commence growth too early and be injured by spring frosts.

*Hydrangea paniculata* is often pruned too drastically, for although larger panicles of flowers may be secured for a time by hard pruning, this eventually leads to the weakening and probable death of the plant. *H. paniculata* is a comparatively long-lived and first-class hardy shrub if it is given rational treatment. The only pruning necessary is a slight shortening of the old flowering growths to retain a shapely specimen, and a light thinning of the growths if they become too dense. F. C. P.

## VEGETABLE GARDEN.

### SORREL.

SORREL does not seem to be grown to any great extent, although it has been known to horticulturists for many years.

McIntosh, in his *Practical Gardener*, states: "There are several species cultivated, and of them some slight varieties differing in the succulency of their leaves, which is their principal merit. Sorrel is used in soups, salads and sauces, and very generally on the continent as a Spinach."

No one need hesitate to cultivate Sorrel, as the plants may either be purchased or raised from seeds.

Sorrel plants are not fastidious as to soil or situation; they grow splendidly when in well-cultivated and somewhat heavy land, the large- and small-leaved forms doing equally well when grown on the same border.

The seeds should be sown in the spring or any time throughout the summer, in shallow

drills made twelve inches to fifteen inches apart. If the seeds are sown thinly, the seedlings may be allowed to grow without thinning. By this method good plants will be obtained in a few months.

The small-leaved variety is compact in appearance and produces medium-sized leaves in quantity. Some plants of the large-leaved kind exhibit reddish-coloured flower stems, while other plants have green flower stems. Both types of the large kind are much coarser-looking than the small-leaved variety.

To increase the stock vegetatively, large plants should be taken up in the early part of the year and the crowns divided, or cut in such a way that each portion will have roots attached. The divided portions should be set out singly in rows. D. A., Midlothian.

### JERUSALEM ARTICHOKE

If not already harvested, this crop should now be lifted and stored, selecting suitable-sized and shapely tubers for planting so soon as possible. If this crop is not in great demand and the ground it is occupying can be spared, there is an advantage in allowing the roots to remain in the soil for a second season, the resultant crop being, naturally, very much heavier.

If this plan is followed, however, some protective measures should be employed where pheasants are numerous, as these birds have a pronounced liking for Artichokes, and dig or scratch their way down to the tubers with an almost uncanny instinct. A. T. H.

## HOME CORRESPONDENCE.

**Failure with Celery.**—With reference to the letter by "F.K." (p. 477, vol. LXXX) on the failure of his Celery, I have also a complete failure identical with his, except that I have had an attack of Celery disease causing the foliage to appear as though scorched. I planted 1,000 plants in three batches; Sutton's Dwarf, Sutton's White and Grove Red; they were planted in properly prepared trenches as is usual to produce good heads. Grove Red, planted in July, has made practically no growth, the others hardly any more, yet root action has been plentiful and clean, but top growth has been practically nil. I am pulling up the whole lot and preparing for Peas. I saw another similar case a few weeks ago near here. Our soil is fairly heavy, resting on chalk, by the river Test near Andover. E. O., Stockbridge.

**Biennial Cropping of Apples.**—The tendency to biennial cropping in Apples, which Grigor Roy denies (p. 496), is recognised by many research workers in this country and in America. Some varieties, of course, possess the habit in much more pronounced degree than others. I find that, whilst most varieties tend to become biennial croppers as the trees age, some exhibit the habit from the beginning of their bearing life, long before they have ceased to make vigorous growth or begun to carry crops heavy enough to need thinning. I do not say that such trees are always absolutely barren in their "off" year; but they have a tendency to bear alternately good and very light crops. I find this notably with Bramley's Seedling. It has long been my belief that the biennial bearing habit is responsible for many of the crop failures that are attributed to frost and other unfavourable weather at blooming time, at any rate, in the south of England. Take the past season, for instance. The weather at blooming time was bad, I admit. In spite of this, some trees managed to set a full crop; and they were those trees which did not bear in the previous year. On my own place, for instance, blocks of Bramley's Seedling which did not bear in 1925 cropped abundantly in 1926, and vice versa. Yet blossoming conditions were the same for all. Also a neighbour, for whom 1926 happened to be the "on" year, secured quite a good crop

of most of the varieties in a plantation separated from mine only by a hedge. Thinning the fruit is routine practice with me for all crops that require it; but I have not found it to be a remedy for biennial bearing. It has failed also in such experiments of which I have seen reports. Apparently, the relief to the tree comes too late. Thinning the bloom is said to have been more successful. Cropping depends on nutritive conditions within the tree; and these are influenced mainly by the amount of crop in the previous season and the weather of that season. Mr. A. H. Lees, of the Long Ashton Research Station, after an examination of cropping and weather records for many years back, comes to this conclusion (*Journal of Pomology*, vol. V, No. 3). He advances very reasonable explanations for the exceptions to biennial bearing, which occur from time to time. With regard to the attempts which have been made to overcome biennial bearing, the most hopeful results have followed special methods of manuring; but nothing very definite has been achieved over any long period, so far as I have seen. It seems possible that the remedy, if there is one, may be found in some combination of pruning and manuring. Obviously the problem is of immense importance to market growers; and any one who solves it will do a great service to horticulture. Market Grower.

### Rabbits and Mice Damaging Fruit Trees.

Where rabbits are plentiful it may be necessary to protect the stems of young trees with wire-netting to a height of four feet, or the stems may be painted with some distasteful material. A suitable mixture may be prepared by reducing fresh cow manure to a consistency of paste and adding sufficient tar to make it adhesive. Field voles are also very destructive in some districts and do much harm to fruit trees. They frequently gnaw the bark just below the soil level, and their depredations may easily go on unobserved until much damage is done. They sometimes climb into the trees also and gnaw around the spurs. This evil is very difficult to combat, as extermination by trapping is scarcely possible and painting the bark with a distasteful preparation seems to be the only remedy. A.

**Salvia Pittieri.**—I have been much interested in the reference to *Salvia Pittieri* in recent numbers of *The Gardeners' Chronicle*. Your correspondent, Mr. Bolas, most kindly sent me young plants of his *S. Pittieri* in bloom, and they prove to be the same as the plant I grow as *S. fulgens*. My plant was determined for me by the authorities at Kew several years ago, when they asked me for cuttings, as at that time it was not being grown there. Are *S. Pittieri* and *S. fulgens* one and the same species? Or, if distinct, is the former now in cultivation? I believe it was first listed by Messrs. Gauntlett about 1914, and the description in their catalogue agrees well with *S. fulgens*. In mild districts *S. fulgens* is a magnificent plant where it is quite hardy and quickly forms a bush eight feet high in a sheltered border. The large, bright scarlet flowers are borne in profusion from mid-summer till hard frost puts an end to them. I have often had the plant in flower at Christmas. N. G. Hadden, West Porlock, Somerset.

**Value of Deep Trenching.**—Referring to the value of deep trenching, as demonstrated in your issue of December 18, the very marked difference in the Broccoli on the trenched and on the dug land at Aldenham shows very conclusively the value of the former, although many will ask, Where is the money to come from to pay the worker? That it pays no one can deny, but the trouble is often to get owners to realise that it does pay, consequently the greater the publicity Mr. Beckett's pictures receive, the greater should be the productiveness of the land. In these days of vast unemployment, this appears to me an opportunity which should not be lost. Let "the pictures tell the story." My knowledge of the actual value of deep trenching is limited to providing a good root-run by the opening up and pulver-

ising of the soil, thereby providing better drainage and paradoxically increasing the available water content of the soil for the use of the plants. Doubtless, Mr. Beckett could give more and better reasons. I have been informed that deep trenching is a good practice to combat the trouble among Strawberries, and I shall be pleased to know if readers have found it prevent, or cure, the very marked weakness which has been prevalent among Strawberries for the past four or five years. J. E.

**Salvia carduacea.**—I recently had the Thistle-leaved Sage through my hands, and it may be considered as curious as it is rare. At first sight I took it to be *Morina longifolia*, but the dissection of the flowers soon dispelled that view. It is figured in the *Botanical Magazine*, t. 4874, and there the floral leaves are compared to those of *Morina persica*. Bentham in giving the specific name, has compared it to a Thistle (*Carduus*), and this is not inapt, considering the spiny character of the foliage and bracts. There is only one species of *Salvia* with spiny foliage and it comes from California, where the dry climate would seem to have developed this peculiar habit. The flowers are pale purple, with deep orange-coloured anthers, and though the plant cannot be described as showy, it is certainly conspicuous. *S. carduacea* was first introduced by Messrs. Veitch, of the Exeter and Chelsea nurseries, and was figured in the *Bot. Mag.* from specimens obtained from that firm. It was discovered by Mr. Lobb, their collector, in 1854, and appeared as an introduced plant in the following year. The traveller Douglas and Dr. Coulter collected the species in 1833 in several parts of California, including the Sacramento Valley, Los Angeles and San Bernardino. J. F.

**Saxifraga Cotyledon icelandica.**—In his notes, on p. 471, vol. LXXX, Sir Herbert Maxwell pointed out that *Saxifraga Cotyledon icelandica* has no connection with Iceland. As a matter of fact, is "icelandica" the correct name? In the chapter on *Saxifraga* in *The English Rock Garden*, the late Mr. Farrer remarks:—"the finest (variety of *S. cotyledon*) is the superb *S. c. islandica*, from the far north, with enormous rosettes, often more than a foot across . . . in tones of iron and bronze, with the most amazing spike to match of four or five feet . . . on the oolitic limestone of the garden at St. Johns, at Oxford, whence it first broke forth upon a dazzled world, it thrives, or thrives with all its might." I was interested in Mr. Elliott's note on *Saxifraga Cotyledon* (vol. LXXX, p. 427), having grown *S. C. pyramidalis* for over twenty years in pots, as a decorative subject for the cool greenhouse. There is one detail in his method of culture we do not practice, that is the removal of the side growths or off-sets from the growing plant after it is first potted until it reaches the flowering stage. After flowering the rosette is useless, so that if the offsets removed are not preserved, the grower would be without a stock for another year. We remove the offsets after flowering, and dibble them into boxes, grading and placing them in small pots when they are established. F.

**Vita Glass for Orchid Seedlings.**—Has any reader of *The Gardeners' Chronicle* tried Vita glass—that allows the ultra-violet rays to pass through and has proved such a boon to crippled children and others—for seedling Orchids? I find our seedlings of *Odontoglossum* practically stand still during the four dark winter months, and some damp off during very humid periods. Our climate, here, has usually 90% of humidity, and, naturally, during the coal strike, when for some time our houses were down to 43°, we lost more than our usual percentage. I have three houses, about forty feet by twelve feet; the first two communicate under the staging, and *Odontoglossum crispum* germinates very freely in the first house, but hardly at all in the second, although the temperature must be the same in each as there is communication near the pipes, but not at all in the third house, although

the conditions appear the same in all three. I cannot help thinking that this new glass is going to prove a great boon to horticulture generally, and for seedling Orchids in particular, especially during winter, therefore I would very much value the opinion of others regarding its use. R. Brooman White, Ard-darroch, Garelochhead, Dumbartonshire.

**Thrips on Orchid Seedlings.**—No doubt some of your numerous readers can help me in my difficulty. We are very much bothered with thrips, notwithstanding all our efforts to combat the pest. Our houses are surrounded by trees, and I fancy fresh batches of thrips come in from these. What we require is some sort of deterrent such as Tobacco leaves placed on the hot-water pipes, but price precludes their use in this country, although the Belgian growers use them on all occasions, and thrips are an unknown quantity—to them. I am wondering whether camphor would be of any use; as camphor is derived from a tree, would the emanations be injurious, say, to seedlings of *Odontoglossum*? R. Brooman White, Ard-darroch, Garelochhead, Dumbartonshire.

## THE MANAGEMENT OF BOWLING GREENS.

THE bowling season of 1926 ended in a week of glorious weather, and when the end of September arrived the conditions for bowling were so favourable that many clubs extended their season of play for a week. This, however, was not possible on most municipal greens where work had been arranged to be commenced so soon as play was over. In view of the fine summer the turf in most cases showed signs of wear, and rest from play came none too soon for the good of the greens.

Bowling greens require very careful attention during the autumn and spring owing to the nature of their construction, and one of the most essential details is keeping the surface dead true.

At the close of a long season's play the turf is sure to become worn badly in places, and some parts of the green may need relaying. The green-keeper should determine early the amount of turf required for replacement, so that it is at hand before severe weather sets in. Make the area to be relaid square at the edges, place the new turves with the apex pointing to one corner of the green so that they are laid diagonally, and take care that each turf is dead level with the existing surface. After worn places have received attention, the next point to consider is the question of weeds, which must be removed entirely and in such a manner that the least possible disturbance of the surface is occasioned. Holes or depressions made in removing weeds should be made good with sea sand; it may be necessary to plug big holes made in removing large weeds with small pieces of turf pushed in with the fingers. The chief weed of Cumberland turf is the Sea-pink, which must be eradicated, stolons and all, and in new greens may not wholly disappear under two or three seasons. Take care to keep paths and turf in the vicinity of the green free from weeds, and never allow grass to seed near bowling greens. Clover should never be permitted but removed directly a plant of it is detected.

When returfing and weeding are completed, next ascertain whether the surface is perfectly level. Newly-laid greens are sure to have sunk in some places and these parts must be made true. This is best done by removing the turf and placing sufficient sea sand under to ensure a perfectly level surface.

In some greens, especially those constructed on a soil base, worms are troublesome and should be exterminated either in early autumn or spring. Worm casts make accurate play impossible, and the continual brushing of the casts injures the surface and exposes the roots of the grasses. The treatment is as follows: leave the ground unrolled for some days in order that the worms

may open up their runs, then, on a warm, moist day, distribute a reliable worm-killer at the rate of half-a-pound per square yard of surface; a full-sized green (forty-two yards by forty-two yards) will require six to seven hundredweights of the worm-killer. Water the turf by means of a hose, using sufficient to make the worm-destroyer into a lather on the surface. The worms, when they reach the open, are not always killed and should be swept up and carted away at once.

The next important detail is the application of sand and manure as a top-dressing. Mix six cubic yards of finely-sifted sea-sand with two hundredweights of grass fertiliser. Distribute the mixture over the green and work it into the turf by the back of a wooden rake or the special implement made for the purpose. The small depressions and hollows will become filled with the sand and the surface made true. With these operations completed no further attention is needed until early spring, when it becomes necessary to prepare for the coming season's play. Arthur Keeling, Park Superintendent, Southend.

## GLASGOW BOTANIC GARDENS.

THE Botanic Gardens in the Great Western Road, Glasgow, are really the third institution of the kind founded in the city. The first botanic garden, called "the Physic Garden," consisted of a portion of College Green, High Street, which was set apart about 1790 by the University authorities for the cultivation of medicinal plants, and it was reserved for students.

In 1815, Mr. James Hopkirk of Dalbeth, who was an enthusiastic botanist, formed a society for the purpose of establishing a botanic garden that would be available for the citizens. As he had great influence among the Glasgow merchants, Mr. Hopkirk's scheme was speedily successful, and in 1816, Dr. Cleland, the City Chamberlain, wrote thus: "The subscribers to the Royal Botanic Garden were erected into a Corporation by the Prince Regent and Council; Dr. William Jackson Hooker so justly distinguished for scientific acquirements, is the first Professor." Sir William Jackson Hooker was Regius Professor of Botany at Glasgow University, and afterwards the famous Director of Kew Gardens. It was he who persuaded the college authorities to contribute a large sum towards the Botanic Garden project on the condition that the place might be used for teaching botany to the students.

In 1816, a plot of ground, eight acres in extent, was purchased at the west end of Sauchiehall Road, stretching from the present Royal Crescent southwards to Dumbarton Road, and bounded on the east by what is now Claremont Street. The ground was laid out in the following year, and Mr. Hopkirk presented many specimens from his own garden at Dalbeth. Though now covered with streets and tenements the spot was quite rural at that time, the only houses near being the villages of Anderston and Finnieston on one side and Partick on the other. Before twenty years had elapsed the buildings were encroaching upon the neighbourhood in all directions; and in 1838 it was found expedient to sell the ground of the old botanic garden to the builders who had projected streets to occupy its site. The whole of the space is now occupied by streets and modern terraces; and Finnieston Station is directly opposite where the gate of the garden stood, in Dumbarton Road. Thus the second Botanic Garden came to an end, after having had but a comparatively short existence.

The Royal Botanic Garden Company was not wound up at this period, but was continued for the purpose of establishing a similar institution elsewhere. In 1839, ground was acquired in the Great Western Road, where it is still in existence. This road had been formed and several streets had been laid out in Hillhead; but there were no houses nearer to the gardens

## SOCIETIES.

## ROYAL CALEDONIAN HORTICULTURAL.

THE December monthly meeting of this Society was held at 5, St. Andrew's Square, Edinburgh, when Mr. W. J. Thomson, President, occupied the chair. A paper was read by Mr. Adam Knight, Brayton, Carlisle, on "The Educational Value of Horticultural Exhibitions."

The exhibits were: Sweet Peas, by Mr. D. ARMSTRONG, The Drum, Edinburgh; Chrysanthemum Yellow Favourite, by Messrs. Wm. MARSHALL AND Co., Belleisle Gardens, Ayr.

## MANCHESTER AND NORTH OF ENGLAND ORCHID.

FRIDAY, DECEMBER 17, 1926.—Committee present: J. B. Adamson, Esq. (in the chair), Messrs. H. Astley-Bell, C. Branch, A. Burns, A. Coningsby, J. Cypher, J. Evans, A. Keeling, D. McLeod, E. W. Thompson and H. Arthur (Secretary).

## FIRST CLASS CERTIFICATES.

*Cypripedium Crusader* (Lucifer × Julian).—A fine flower; the dorsal sepal measures nearly three-and-a-half inches across and has a crimson ground and white margin; the lip is mahogany colour, the petals being a lighter shade,

*Cypripedium Christo-Moorei* (nito Hallii × Lady Dillon × Christopher Grand Duke Nicholas).—The large, dorsal sepal has a white-green base and purple spots with purple lines up the centre; the petals are green with bronze lines,

*Cypripedium Chrispostum* var. *Any Moore*.—The dorsal sepal which measures four inches across, has a spotted base and a deep white margin.

*Cypripedium Baldur*, *Westonbirt* variety (G. F. Moore × Niobe).—A flower of good shape; the dorsal sepal has crimson markings and a green base; the petals and lip are coloured dark brown. The above four were from S. GRATRUX, Esq.

*Cypripedium Lucifer*, *Holford's* variety.—A well-shaped flower; the dorsal sepal has crimson lines with a green base; the lip and petals resemble those of C. Niobe. From Mrs. GRATRUX.

*Brasso-Cattleya British Queen* var. *Thunderer*.—A large, well-shaped flower with a broad, spreading lip that is well frilled. From J. B. ADAMSON, Esq.

*Cypripedium Ranleigh* (Bianca × Christopher).—This flower has a yellow dorsal sepal with a broad, white margin. From H. J. BROMILOW, Esq.

## AWARDS OF MERIT.

*Odontioda Lecana* var. *Illustre*; *O. Marjorie* var. *Armeniacae*; *Cypripedium Royalist* (Germaine Opoix × gigas); *Laelio-Cattleya Schröderae*, var. *Princeps*; *L.-C. Schröderae* var. *Luna*; *Cattleya Maggie Raphael alba* var. *Exquisita*; *Cypripedium Anita* (Bianca × *Sanacderae*). From J. B. ADAMSON, Esq.

*Cypripedium Clara Gibbons* (*Troilus Cravenianum* × *Harefield Hall*); *C. Cathie Redmayne* (*Troilus* × *Beryl*); *C. Chrispostum The Prince*. From D. LOSH SMITH, Esq.

*Cypripedium Bendigo* (Niobe × *Bronzino*); *C. Imperator* (*Alcibiades* × *Pyramus*). From Messrs. H. G. ALEXANDER, LTD.

*Cypripedium Shamus* var. *Shaun*. From Mrs. BRUCE and Miss WRIGLEY.

*Odontioda Cardinale* var. *Dora* (*Schröderae* × *eximium Shackletonii*). From Mrs. P. SMITH. *Cypripedium Nesta*, *Westonbirt* variety. From S. GRATRUX, Esq.

*Cypripedium Mrs. Eley* (*Christopher* × *Warrior*).—From Messrs. A. J. KEELING AND SONS.

## GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded.

A Gold Medal was also awarded to a group staged by S. GRATRUX, Esq., West Point (gr. Mr. C. Branch).

Messrs. J. CYPHER AND SONS, Cheltenham, were awarded a Silver-gilt Medal for a miscellaneous group of Orchids.

A Large Silver Medal was awarded to Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), for an exhibit.

## ROYAL HORTICULTURAL AND ABORIGINAL CULTURAL OF IRELAND.

THE ninety-seventh annual general meeting of this Society was held at the offices, 5, Molesworth Street, Dublin, on December 21, 1926, with the President, the Marquis of Headfort, presiding. The report and balance sheet for the year ending December 1, 1926, disclosed a healthy and satisfactory condition of this veteran Irish Society. With an addition of 140 new members during the year the roll stands higher than hitherto in its history, and the cash balance showing a credit of £274 7s. 5d., with no liabilities, confirmed the President's optimistic views for the future.

Sir Frederick Moore, Hon. Secretary, made sympathetic reference to the Society's loss in the death of Sir John Ross of Bladensburg, K.C.V.O., a Vice-President for many years. The meeting was well attended, and a vote of thanks to the Chairman was passed by acclamation.

## Obituary.

**J. Cakebread.**—It was with a deep sense of loss that I learned of the passing of an old friend, in the person of Mr. J. Cakebread, on Friday, December 17, for it is now many years since I first knew him, when he was gardener to the first Sir Philip Rose, Bt., and his son, the late Sir Philip Rose, Bt., at Rayners, Penn, Buckinghamshire, at the time my late father was bailiff on the same estate. They were colleagues for upwards of a quarter of a century, and the amicable way in which they worked together during those years was a fine example to all men. Mr. Cakebread was in his post for about forty years, and was a keen and clever all-round gardener, making a speciality of fruit, and particularly of Strawberries in pots; he was a well-known exhibitor, winning many successes at the London and other shows of his day. For many years he was Churchwarden at the Church at Tylers Green, near Penn, where he was laid to rest on Wednesday, December 22. His wife, who is only a few months younger, survives, as do two sons and a daughter, and the many that knew him will, I know, extend their heartfelt sympathy to the family of this worthy craftsman who had reached the advanced age of ninety-three years. E. Beckett.

## TRADE NOTE.

DURING the past year, Messrs. Sutton and Sons received a visit from H.R.H. The Prince of Wales, who inspected their trial grounds and planted a tree to commemorate his visit. On the occasion of the Royal Agricultural Society's show at Reading, the firm's exceptionally fine demonstration garden, and their exhibit of 20,000 spikes of Sweet Peas, were greatly admired by their Majesties, King George and Queen Mary. In addition to Royal favours, Messrs. Sutton and Sons were particularly successful at prominent exhibitions in 1926, once again winning the Sherwood Cup for the most meritorious group at the great Chelsea Show, and obtaining both the Bath and Eastbourne Cups at the National Sweet Pea Society's show at Cheltenham, as well as two Gold Medals. During 1926, the Reading firm were awarded in all, five cups, a set of Coultport China (Shrewsbury Floral Fete), and thirty-three Gold Medals—a record of which even Messrs. Sutton and Sons may be justifiably proud.

JANUARY 1, 1927.

than a few terraces in the neighbourhood of what is now St. George's Cross, and the site was surrounded by green fields. The bridge over the Kelvin, on the line of the Great Western Road, was built in 1838-40, enlarged in 1859, and reconstructed in 1891; but it was chiefly used as an access to Hillhead, until the Woodlands Road Bridge was built over the Kelvin in 1853. When the Botanic Gardens ground was purchased in 1839 the whole district was rural, the only houses being a few small cottages with thatched roofs scattered about the site, the last of which remained in existence till 1880. The nearest mansions were North Woodside House, Kelvinside, Gairbraid and Byres of Partick.

The ground for the new Botanic Gardens extended to twenty-two acres, and the place was ready for occupation in 1842, though many additional glasshouses were erected afterwards. The scheme was carried out on a much larger scale than was ever contemplated by the projectors. The expense of conducting such an undertaking was too much for the private subscribers; in 1863 an effort was made to increase the revenue, and several magnificent gifts of money were made by private citizens. This did not serve to make the concern prosperous, however. The Corporation of Glasgow was appealed to, and money was advanced on bonds upon the property.

Another difficulty arose through the acquisition of what seemed at first a splendid addition to the Botanic Gardens. In 1871, Mr. John Kibble agreed to remove his magnificent conservatory from Coultport, and to re-erect it in the gardens under the name of the Kibble Palace. He stipulated that he should have a free lease of the place for twenty-one years for concerts and other similar purposes; but this arrangement had ultimately a deleterious effect upon the Gardens. The Directors found it necessary to buy out this right and to reconstruct the Kibble Palace as a winter garden.

These expenses plunged the affair into a hopeless state of debt, and in 1887 the Corporation, as principal bond-holder, was invited to take possession of the Gardens. By the Act of 1891, whereby Hillhead and Kelvinside were annexed to Glasgow, it was provided that the Botanic Gardens should be ranked as one of the public parks. The debt due to the Town Council at this time was about £60,000; a part of the ground called Montgomery Wood, extending to eight-and-a-half acres, was purchased for £3,800 and added to the Gardens, and thus the whole cost to the city has amounted to about £64,000, which includes all the conservatories and rare plants. The Kibble Palace is acknowledged to be one of the finest structures of its kind in Europe. A. H. Millar.

## PUBLIC PARKS AND GARDENS.

BRIGHTON Corporation has under consideration a scheme, drawn up by the Superintendent of the public parks and gardens, for the transformation of Preston Park into a Continental Park of terrace and alpine gardens, boulevards, and a lake six acres in area. The estimated cost is £50,000.

TEIGNMOUTH Urban District Council has under consideration the question of the purchase of the Clifden Estate, with the residence, for the provision of a public park and pleasure ground.

ALSAGER Urban District Council has given instructions to the surveyor to draft a scheme for the provision of a recreation ground.

THE Parks Committee of Edinburgh recommends the laying out of ground at Chessell's Court as a recreation ground, at a cost of £200.

GRANGEMOUTH Parish Council has approved a scheme submitted by the Landward Committee for the reclamation of the Redding Loch, Redding Village, and its conversion into a recreation ground.

REMARKS.—A full supply of Chrysanthemums was maintained during the Christmas week with the exception of good bronze and yellow blooms, and prices remained normal. The colder weather was responsible for a shortage of Carnations and Roses, and the latter flowers advanced considerably in value towards the end of the week; good red blooms were very scarce on Christmas Eve. The prices of Lilium longiflorum and Richardias (Arums) gradually advanced during the week. The newest subjects in this department are Daffodils and Tulips, including a few Wm. Copland, which came to hand this morning. Supplies generally were shorter to-day and a further advance in prices is anticipated this week for all subjects.

REMARKS.—General trade conditions have been quite satisfactory. Supplies of fruits for Christmas were ample, and prices being reasonable, a considerable amount of fruit was disposed of. Imported Apples are slightly cheaper. A few English Apples are still available, but only Bramley's Seedling and Cox's Orange Pippin are in demand, other varieties being a very slow trade. Hot-house Grapes are selling well in spite of the competition of choice fruits from the Cape, which have arrived in good condition. Forced Beans are scarce and costly; a consignment of Beans from Madeira sold well. Mushrooms are more plentiful, but prices are steady and satisfactory from the growers' point of view. New Potatoes from Guernsey, Selly and the Azores are a fairly good trade. All salads have sold well, but at the time of writing the tendency is for quieter conditions in this section. A few Tomatoes and Cucumbers are arriving, and, if of good quality, sell well. Trade in green vegetables is quiet, but Potatoes are in firm request.

## GLASGOW.

Cut flowers were very scarce and dear during Christmas week. The biggest advance conceded by buyers was for Roses, which were worth double the price obtained in the previous week. Pink varieties ranged from 10/- to 16/- per dozen; red from 10/- to 12/-; and white from 6/- to 8/-. Carnations appreciated by 3/- and 4/- to 7/6 and 10/-, while Narcissus rose to 20/- and 26/- per pad. Chrysanthemums are just about finished for the season, and the quality of the blooms was very mixed; Framfield Pink ranged from 4/- to 5/- per dozen; Favourite, W. Duckham, Mary Norris and Golden Glory, 2/- to 2/6 for 6's; Western King, 1/- to 1/6; Wilcox, 8d. to 1/6; Baldock's Crimson, 7d. to 1/6; and Winter Cheer (Dunstable-grown), 8d. to 1/3. Tulips in pans made 2/- to 2/6; Holly, 2/- to 4/- per small bag, 4/- to 6/-, large; Christmas Trees, 6d. 9d. and 1/- per foot. There were no arrivals of Mistletoe. Solanum berries declined from 8/- to 10/- per pad, to 4/- and 6/-; while Ruscus was 4/- down at 10/- to 12/- per double pad.

The fruit market was fairly active, but prices remained steady and unchanged. Apples were in moderate demand at previous quotations, and while Jaffa Oranges at 12/6 to 15/- per case were cheap, Valencia 300's were dearer at 23/-; Mandarin varied from 12/2 to 2/4 per tray, and Blue Goose Grape Fruit averaged 35/- Scotch Cohmar Grapes were unaltered at 3/6 to 3/9 per lb; Almerias were cheaper at 32/- per barrel.

## ANSWERS TO CORRESPONDENTS.

FUMIGATING ADIANTUM FERNS.—S. I. Fumigating with XI All Nicotine should not harm Maidenhair Ferns and vines, but do not use the specific at full strength when the foliage is young.

NAMES OF FRUIT.—E. M. 1, Newton Wonder; 2, not recognised.—H. B. O. B. A, not recognised; badly deformed; B, Nec Plus Meuris. J. C. W. & S. Tower of Glamis.

## PEAR TREES FAILING TO FRUIT SATISFACTORILY.

—T. E. The name is Pitmaston Duchess, and not as you spell it; it is a very fertile variety and a strong grower. From your statement of the tree making robust growth, flowering freely and failing to fruit, root-pruning is necessary, and this should be done at once. Pruning the strong shoots as you have done only results in a thicket of strong growths each succeeding year, and as you have dug down to the roots of the trees and nourished them with manure, this has accentuated the trouble. Open out a trench a few feet from the stem of the tree, and when you have dug down about one-and-a-half feet or two feet, excavate beneath the roots and endeavour to find out if there are any very strong ones growing in a downward direction. These should be severed, and if you can get at them, make the ends smooth with a sharp knife.

REPAIRING A MULBERRY TREE.—H. A. Rather than fill the large crack in the trunk with clay or cement, we should prefer to use a dry material, such as broken brick or corks: fill to within a few inches of the surface and then crown the cavity carefully with the bitumen. We assume that the damage is recent, otherwise it will be advisable to thoroughly clear out all decayed matter and dress with creosote or Stockholm tar. The cavity should be as dry as possible before it is filled and crowned.

WEEVILS EATING THE ROOTS OF MAIDENHAIR FERNS.—J. P. The grubs are the larvae of the Vine Weevil. The great difficulty of detecting weevils is due to the fact that they feed principally at night, hiding by day. An old method of reducing their numbers is to enter the greenhouse at night with a lantern and catch them on the plants, or if you stand the plants on a white sheet and disturb them by a light at night, they will fall on the sheet and be easily caught. The larvae are more difficult to catch, and for their destruction carbon bi-sulphide injected in the soil near the roots of the plants is to be recommended. Make holes with a piece of stiff wire and pour about a teaspoonful of carbon bi-sulphide into each hole. This fluid is very inflammable and needs care in handling.

WOOLLY APHIS.—C. R. I. It is doubtful whether Carbokrimp, applied at the usual winter strength and during the winter period would have any effect upon woolly aphis, because this pest is probably then in a state of hibernation in inaccessible places. You are no doubt aware that the woolly aphis migrates to the roots of the tree in such periods, and only a flooding of the soil with a solution of Carbokrimp is likely to reach them, and it is open to debate whether the application of a fluid would have any effect at a concentration which would not be detrimental to the tree. Therefore, it is quite the usual procedure to paint the little nests of woolly aphis with Carbokrimp when they are above ground, particularly in the summertime. At the same time, canker wounds which are often attacked by woolly aphis will respond to a painting with Carbokrimp at a strength ranging from twenty-five per cent. to the neat material, this depending upon the stem, twig or branch to be treated.

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to advertisers of vacant situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

### PRIVATE.

**WANTED**, LADY SHORTHAND TYPIST with experience of nursery and seed business well educated and efficient.—A. B. C., Box 61, 5, Tavistock Street, Covent Garden, W.C.2.

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required; but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid it will appear the following week, unless countermanded in the meantime.

### PRIVATE.

**ADVERTISER** wishes to treat with lady or gentleman requiring the services of a thoroughly reliable MAN to manage gardens, land and estate; good organiser and manager.—Particulars to 1, Kenyon Avenue, Garden Village, Wrexham.

reduces the fuel bill and saves labour.

Estimates on application Free.

## The Hairdresser does not cure toothache!

IT would surely be an error of judgment, to say the least of it,  
if a sufferer from toothache consulted his barber instead of  
his dentist! Very similar is the case of the Glasshouse owner who  
thinks that his repairs can be carried out by carpenters and  
glaziers. He, too, is trying to put a square peg into a round hole.  
Nearly a century's experience in Glasshouse building and repair-  
ing has fully qualified William Duncan Tucker and Sons Ltd.  
for any work connected with Glasshouses. They are the people  
who *know*. Let them help you.

# SUTTON'S SEEDS

## SUTTON'S GARDEN PEAS From May to November

Our marrowfat peas hold an enviable reputation for productiveness and flavour and for the length of time under which, with suitable culture, they may be obtained.

Following are a few of our most popular varieties:

For earliest crops, dwarf—

**SUTTON'S PIONEER**, per pint, 2/6, quart 4/6

**SUTTON'S LITTLE MARVEL**, per pint 2/3, quart 4/3

For earliest crops, taller—

**SUTTON'S EARLY GIANT**, per pint 2/6, quart 4/6

**SUTTON'S DELICACY**, per pint 2/6

For second early crops—

**SUTTON'S PHENOMENON**

(seed very scarce)  
per pkt. 3/6 & 5/-.

**SUTTON'S SELECTED DUKE OF ALBANY**, pint 2/6, quart 4/6

For medium and main crops—

**SUTTON'S PEERLESS**, per pint 2/6, quart 4/6

**SUTTON'S MAINCROP**, per pint 2/-, quart 3/9

For latest crops—

**SUTTON'S SELECTED GLADSTONE**, pint 2/6, qt 4/6

Price Lists of the best Garden Peas and other Vegetable Seeds, Flower Seeds, Seed Potatoes, Garden Sundries, Horticultural Fertilisers, etc., see "Sutton's Garden Seed Catalogue for 1927,"  
Post Free.

EVERYONE interested in the Potato and Potato-growing Varieties I.\*—whether raisers of new varieties, merchants or growers—has reason to be grateful to Dr. Salaman. For well nigh twenty years he has devoted himself to the study of this important plant. As Chairman of the Synonym and Potato Committees of the National Institute of Economic Botany, he has played a leading part in pruning the over-grown tree of Potato nomenclature and in reducing it to a more tolerably trim state. Thanks, in large measure to him, we no longer need be confused by the numerous varietal aliases which—though still unfortunately with us—are now knowable for what they are. Dr. Salaman has, moreover, played a valuable part in encouraging and practising the application of scientific methods to the raising of new varieties and—perhaps the most conspicuous of all his services—he has pointed out the gravity of the menace of Mosaic diseases to the successful cultivation of the Potato. Dr. Salaman is, therefore, well-equipped for

the task which he has set himself, i.e., that of describing the varieties of the plant, showing what are the powers which preside over the origination of new varieties, and indicating what are the behaviour and destiny of these varieties. The author has done wisely in not attempting to deal with the Potato in all its aspects, for by limiting the scope of his book he has been able to concentrate upon essential problems. Of these problems the most important of all is the precise and clear diagnosis of existing varieties. For although it is true that our seedsmen take an infinity of pains to keep their stocks and the "seed" which they distribute free from rogues, yet the fact remains that not all stocks grown in our fields are pure. Yet upon the consistent truthfulness to type of Potato stocks the success of the crop in no small measure depends. Those who take an interest in origins will be specially grateful to the author, to Messrs. Sutton and Sons, and to Mr. Lasham, the Potato expert of Messrs. Sutton's, for compiling and publishing the parentage and the names of producers and raisers of most of the varieties described in this book. The work begins by a clear definition of the meaning of the word variety, and then proceeds to show that the Potato, as introduced into Europe in the latter half of the sixteenth century, consisted of two varieties with characteristics similar to those in cultivation at the present time, and quite different from those of known, wild, tuber-bearing Solanums. One—that figured by Clusius, was a deep red variety, and the other—that described and figured in Gerard's *Herbal* (1597), is a white-skinned variety. They were, however, inferior in shape to existing Potatoes. Both the one and the other were irregular, deep-eyed and disfigured by outgrowths, and it was not until the nineteenth century that varieties were produced of more symmetrical contour. It is fortunate for the subsequent history of the Potato that neither of the two original varieties was pure bred. Evidence exists which shows that Clusius' Potato was a hybrid with respect to flower colour, and probably also with respect to colour of tuber. Breeding began mostly in an indiscriminate fashion in the eighteenth century, at which period Potatoes seeded freely and varieties soon became extremely numerous. But Nature intervened somewhat tardily, and in her usual enigmatical fashion. In 1845 and the succeeding year Late Blight (*Phytophthora infestans*) devastated Potato crops. Many varieties proved devoid of powers of resistance, and many persons set about the task of discovering varieties which offered some measure of resistance to the disease. Chief among these early investigators was William Paterson, of Dundee (1811-1870). His theories were all wrong, his methods were crude, but, nevertheless, he delivered the goods in the form of numerous, fine, new varieties. According to Dr. Salaman, the "blood" of one of his varieties, Paterson's Victoria (1856), produced by raising seed from self-set berries on kinds collected from the ends of the earth, runs in most, or all, present varieties of outstanding merit. Magnum Bonum, a variety introduced by Messrs. Sutton in 1876, and Champion, displayed for a long time striking resistance to blight, but their power of resistance was not permanent and now, having played their part, they no longer appear on the stage. This period may be said to close with the production of two of the finest varieties ever raised, Scottish Triumph, that is Up-to-Date, introduced by A. Findlay, and Sutton's Abundance. In recent times

new problems have arisen—how to breed varieties resistant to Wart disease, and more recently, how to produce varieties immune to Mosaic disease. In the attempts to solve them, science is lending powerful aid, and is showing why the solution is proving so difficult, but neither the scientific breeder, nor the hawk-eyed breeder who works on non-scientific lines, has yet succeeded in evolving a completely successful solution. That is for the future; nor having regard to what has been done in the past need we be unduly pessimistic as to ultimate success. One of the most notable advances that has been made recently consists in the new conception of the degeneration of varieties. According to the older view, every variety was predestined to degeneracy. It was betrayed by what was false within! Science now rejects this view completely. Degeneration is the outcome of disease, and the disease which step by step saps the virtue of a variety is of extraneous origin. From a practical and immediate point of view, however, it makes no great difference which view be adopted, for the fact remains that on the average a variety "runs out" in the course of a quarter-of-a-century. There are exceptions. Myatt's Ashleaf Kidney is said to be one-hundred-and-fifty years old. Magnum Bonum, although it only lasted thirty years in this country, is at the present time, and with a varietal age of fifty, still one of the most popular varieties in Sweden. We have lingered so long over these fascinating early pages that there is now neither time nor space to finish our review. We propose therefore, to complete our task in a subsequent issue. Before concluding this first instalment, it is important to point out that the practice of saving immature tubers for seed has the sanction of both experience and of scientific observation. The reason for the superiority of immature seed lies in the fact that the young tuber is less likely to have become infected with virus disease, which may be, and often is, already present in the older parts of the plant.

**London Daffodil Show.**—The Schedule of Classes for the London Daffodil Show, to be held at the Royal Horticultural Hall, Vincent Square, Westminster, on April 12 and 13, has been issued, and copies may be obtained on application to the Secretary of the R.H.S. Eighty-three classes are provided, and these are grouped in seven sections, viz., Open classes (20), New Varieties, open classes (9); Market Classes (8); Single Blooms, open classes (20); Amateurs only, varieties in commerce (9); Novices only (9); Amateurs' Collections (1); and Decorative Classes (7). Cash and Medals are offered as prizes, but while the R.H.S. offers the medals, Messrs. E. A. Bowles, P. R. Barr, and C. H. Curtis are responsible for the cash awards. The Market Classes have been extended, but we consider that to "deliver the boxes of flowers tied, labelled and addressed to the Secretary of the Royal Horticultural Society, Vincent Square, Westminster, S.W.1, not later than the evening before the show" is not a fair test for classes for boxes of Daffodils "as packed for market." In our opinion, the boxes of flowers should submit to a journey by rail before being judged.

**Horticultural Club.**—The Horticultural Club has arranged a syllabus of Lectures for the Winter-Spring session, 1927, and on each occasion a dinner will precede the lecture:—January 11, Mr. W. Cuthbertson, on "Some Horticultural and other Notes Gleaned on a World Tour"; February 8, Mr. Herbert Cowley, on "A Vagabond in Majorca," illustrated by lantern slides; March 8 (annual meeting), Mr. F. J. Chittenden, on "Some American Impressions"; April 5, Mr. W. B. Cranfield, on

\* *Potato Varieties I.*, by Redcliffe N. Salaman, M.D., Cambridge University Press. Price 25/- net.

British Ferns and their Varieties," illustrated by lantern slides; and May 10, Mr. E. A. Bowles, on "Botany, History and Philology of the Cabbage," illustrated by lantern slides. Non-members may obtain tickets, price 10s. 6d., for each dinner and lecture, from the Hon. Secretary, Mr. Geo. F. Tinley, 855, London Road, Westcliff-on-Sea, Essex.

**British Florists' Federation.**—The tenth annual general meeting of members of the British Florists' Federation will be held at the Connaught Rooms, Great Queen Street, London, W.C., on Friday, January 21, 1927, at 3.30 p.m. The general business will be followed by a discussion on "Gluts of Flowers and How to Prevent Them." The Eighth Annual Dinner will be held at The Connaught Rooms at 6.15 p.m., on the same day.

**Buddleia Forrestii and B. Fallowiana.**—Mr. R. C. Notcutt, Woodbridge, writes: "I was very glad to see your note on page 502 of *The Gardeners' Chronicle*, December 25, 1926, regarding *Buddleia Forrestii* and *B. Fallowiana*. There has evidently been a good deal of confusion between these two species, and what is known in nurseries as *B. Forrestii* seems to be nothing more than a good mauve form of *B. Fallowiana*. It appears, however, there are many variations in the type generally known as *B. Fallowiana*, several being of a weaker habit to that which is sold under the name of *B. Forrestii*. The true *B. Forrestii*, as grown at the Royal Botanic Garden, Edinburgh, is a totally different plant, as Mr. Marquand, of Kew, rightly states, and it is doubtful, from a garden point of view, whether it will become such an attractive plant. In commerce, it is very desirable to get these plants under their correct name, as so much confusion is otherwise caused." We hope to publish further information on this interesting subject in an early issue.

**Flatford Mill and Willy Lott's Cottage.**—Mr. T. R. Parkinson, of Ipswich, has presented these old-world features of English landscape, made famous by the paintings of John Constable, to the nation. Both the mill and the cottage, which are situated about ten miles from Ipswich, and Colchester, and three miles from Manningtree, appear in several of Constable's most famous paintings. The water mill was inherited by Constable's father, from an uncle. Willy Lott's Cottage, which is named after a farmer who was born in the house and lived to be considerably over eighty years of age, was painted by Constable on very many occasions, and is seen on the left in the picture of "The Haywain," one of his masterpieces. Mr. Parkinson has offered to restore the cottage at his own expense so soon as possible. In 1924 a proposal was put forward to acquire the buildings in connection with a scheme for a school of landscape study; Mr. Parkinson is willing to consider any practical suggestions that may be made to further the progress of landscape painting in this country.

**Flora of the Grampian Mountains, Victoria, Australia.**—According to Mr. E. Ashby—whose "Notes" were read, in his absence, by Dr. A. B. Rendle, at the recent meeting of the Linnean Society—the Grampian Mountain range, in Western Victoria, covers an area of about sixty by thirty miles; the rocks are sandstone, with quartzite and intrusive rock in a few places. It forms an ecological islet rising abruptly from hundreds of miles of undulating plains, and is a meeting place of the east and west as regards its flora. Fifteen species are endemic, including four species of the Leguminous genus *Pultenaea*; *Trymalium Daltonii*, a Rharnaceous species with an Ericoid habit; *Calythrix Sullivanii*, a striking Myrtaceous species; *Eucalyptus alpina*, a small tree growing at two thousand feet altitude; *Olearia speciosa* (Compositae); *Leucopogon thymifolius* (Epacridaceae); and single species of the genera *Hibbertia*, *Bauera* (Saxifragaceae), *Stylidium*, *Grevillea* and *Prostanthera* (Labiatae); also a terrestrial Orchid, *Caladenia iridescens*, which flourishes high up in the barren stone mountain soil. Dr. Rendle referred to papers in the *Victorian Naturalist*, by Mr. J. W. Audas, F.L.S., of the National Herbarium, Melbourne, descriptive of the scenery and plant-life in these mountains.

**Mr. Alexander Chalmers.**—While his business interests are centred in Edinburgh, Mr. Alexander Chalmers is one of the best-known seedsmen in the three countries, for he has travelled extensively, and always makes a point of attending the R.H.S. Spring Show, at Chelsea. His early days were spent in the establishment of Messrs. D. and W. Croll, at Dundee, where he remained over eight years. Then he took up a more responsible position with Messrs. Ireland and Thomson, in Edinburgh. Eleven years later the firm was dissolved, and Mr. Chalmers went with Mr. D. W. Thomson as manager. It was at about this time that he began to be known to his many friends as "The Doctor." This honorary degree is in the nature of a tribute to his extensive knowledge of all that appertains to the seed and nursery trade, for Mr. Chalmers has done more than make the most of his opportunities—he has made opportunities; hence his success in life. Twenty years ago, Mr. Chalmers joined Mr. James C. Stewart as a partner in the well-known firm of Messrs. Stewart and Co., of Edinburgh, and, in spite of two most serious surgical operations recently,

MR. A. CHALMERS.

which would have overtaxed the average man, still works hard and retains the optimism and good nature which has made him so many friends and renders him an entertaining companion. Such a man could not be self-centred, and his natural sympathies for his fellows finds one outlet in the Royal Gardeners' Orphan Fund. In his capacity of Hon. Local Secretary for the Edinburgh district, Mr. Chalmers has proved a friend to many who have been so unfortunate as to be left widowed, with young children, and a god-father to the orphans, for, besides helping them to receive the benefits of the Fund, he assists them in other directions. For many years he has also had an active connection with the Scottish Horticultural Association, and the Royal Caledonian Society, of which he is a Vice-President.

**Selsdon Woods.**—Acting in conjunction with the Commons and Footpaths Preservation Society, a local committee of the inhabitants of Selsdon—about three miles from Croydon, Surrey—has agreed to purchase forty-seven acres of woodland at a cost of £95 per acre. During the past year an area of one hundred-and-ten acres was acquired, consequently Selsdon Woods, with its wild flora and fauna, will be preserved in a natural condition for all time. So soon as the purchase of the new area has been completed, greater London will possess in Selsdon Woods one of the finest natural reserves yet secured. We understand that £2,500 has been subscribed towards the £6,000 needed, but several local residents have agreed to lend the money necessary to complete the purchase of this latest acquisition.

**Covent Garden in 1827.**—The following paragraph on the condition of Covent Garden Market and its vicinity was published in the *Times* for January 5, 1827, and reprinted in last Wednesday's edition: "A meeting of the inhabitants of the parishes of St. Paul, Covent Garden, and St. Dunstan's, Fleet Street, was held at the School Rooms, Charles Street, Covent Garden, on Wednesday, for the purpose of addressing some resolutions to clear the streets of the nuisance caused by pickpockets and groups of women, who latterly have thronged the vicinage of the theatres, committing every description of depredation and insult. The meeting, which was respectfully attended, was convened by a circular handed round among the inhabitants, explaining the absolute necessity there appears for the adoption of some means to remedy the apparently defective state of the Street Police, to which the existence of the nuisance was naturally attributable."

**Genetic Congress in Berlin.**—The International Committee elected to arrange the forthcoming Genetic Congress has unanimously decided to accept the invitation of the German Genetic Society to hold the next (fifth) Congress in Berlin: it will take place there from September 11 to 18, 1927. It will have a very international character, three languages (English, French and German) being employed, and at the first sitting other languages can, if desired, be introduced. Besides the reading of papers and a certain number of demonstrations, there will be receptions and fêtes, and on the last day a visit to Potsdam, concluding with a final banquet.

**National Rose Society.**—The annual general meeting of members of the National Rose Society will be held at Caxton Hall, Westminster, on Tuesday, January 18, at 2.30 p.m., for the purpose of receiving the Annual Report of the Council and the Statement of Accounts for 1926, and the election of Officers and Members of Council for 1927. Tea and light refreshments will be provided after the meeting.

**Preserved Peas.**—The consumption of green Peas, preserved in bottles or cans, has increased enormously in recent years, but the preservers are now faced with the difficulty of retaining the green colour of the Peas, owing to the new regulations against the use of preservatives in food, which came into operation on New Year's Day. The Peas in the past have been treated with copper sulphate to preserve the green colouring, but the use of this chemical is no longer permissible. However, Mr. A. Appleyard, Director of the Research Station of the Ministry of Agriculture at Campden, Gloucestershire, states that a natural process of preservation has been evolved which retains the chlorophyll. The canning industry in this country, which meets strong competition with French, Italian and American products, will find the new process of great commercial value.

**Disease of the Bracken.**—The announcement of the discovery of a disease of Bracken on the farm of Knoweside, Maybole, made at a recent meeting of the Scottish Chamber of Agriculture (see p. 2) has created widespread interest among farmers and scientists, and the *Glasgow Herald*, of Dec. 29, last, published particulars of the research work that is in progress to test the possibility of cultivating the disease as a means of clearing hillsides of the pest. These investigations have been conducted by Mrs. N. A. Alcock, Mycologist of the Board of Agriculture, who has found that the disease is of a fungous character, and that it is present at all stages in the affected plants. The most striking characteristic of affected Bracken is its stunted size. In the affected area the plant is rather sparse and the fronds, which have the appearance of being frosted, grow from eighteen inches to twenty-four inches in height. In the area surrounding the diseased patch the Bracken grows to its normal height. The investigator found that the tops of the diseased specimens were dead and that one or more fronds had developed poorly. In many cases the plants had been killed before the fronds uncurled. Another feature was a kind of ring, the centre of

which was formed by plants that were killed by disease, and the fringe of plants partially attacked. There is ground for believing that the infection started in the soft, curled fronds, or made a beginning between the pinnae and the main rachis. In other cases the indications were that it had started at the edge of a young frond where water might have collected. In others again, the evidence was only at the tip. Meantime the fungus is being closely studied, and on several areas on the east coast and on the Pentland Hills, Bracken has been inoculated and is under close observation. Very little has been learned scientifically as yet about the disease, but the important fact meantime is that the affected plants have been definitely declared to be diseased, and that this is the first time the disease has been known to attack Bracken. Having admitted so much, the experts counsel caution as to the possibilities of usefulness which may be developed as they are by no means assured that a biological method of controlling Bracken has been discovered. The practically world-wide distribution of the plant which is found from the Cretaceous period onwards, demonstrates its power of resistance and its vegetative virility, indifference to heat and cold, drought and moisture. This is the first known instance in which Bracken has been known to succumb to any disease. It shares with other plants of ancient descent, like Mosses, Ferns and Club Mosses, a high resistance, and an almost clean bill of health. Rarely is it attacked by a parasitic rust, which, even when present, does not do enough harm to be important. Occasionally some stem fungi are found upon the Bracken, and a few negligible spot fungi on the fronds.

**Federation Horticole Professionnelle Internationale.**—The International Commercial Horticultural Conference will be held this year at Geneva, from June 20 to June 24. The programme, drawn up by M. Vachoux, President of the Swiss Horticultural Association; M. Rochaix, M. Stahel and M. Peter, is as follows: Monday, June 20, 9 a.m., opening of the Conference; 12.30 p.m., banquet offered by the Council of State; 3 p.m., continuation of Conference; 6 p.m., Reception by the Administrative Council of Geneva; 8.30 p.m., performance at the theatre (probable). Tuesday, June 21, 9 a.m., Continuation and conclusion of Conference; 12.30 p.m., Banquet offered by the Association of Swiss Horticulturists; 3 p.m., visit by car to the Horticultural School, reception and visit to the Park Rothschild, the Botanical Garden and the International Bureau of Work; evening free. Wednesday, June 22, excursion on the Lake of Geneva, remaining at Montreaux for the night. Thursday, June 23, ascension of the Rochers de Naye, return to Montreaux and departure for the Bernese Oberland and Berne, remaining at Berne for the night. Friday, June 24, visit to Berne and its environs and reception by the Bernese horticulturists, which ends the programme. The Floral Fete of Geneva, which will take place on Saturday, June 26, will be included in the programme, in case some of the delegates wish to see it.

**The Culture and Manuring of Sugar Beet.**—A conference on the subject of the culture and manuring of Sugar Beet has been arranged in conjunction with the British Sugar Beet Society, and will be held at the Rothamsted Experimental Station, on Wednesday, January 19, at 11.30 a.m. The chair will be taken by The Right Hon. Lord Clinton, D.L., J.P., and the speakers and subjects will include, among others: M. J. M. Van Bommel Van Vloten, Sugar Beet expert to the Netherland Sugar Industry, "Continental Experience with the Growth of Sugar Beet"; Mr. T. G. Fowler, Commercial Manager, Cantley Beet Sugar Factory, "What the Factory Wants and How the Farmer can Supply it."; Mr. I. J. Schapinger, "Effect of Climate on the Cultivation of Sugar Beet"; Mr. R. N. Dowling, County Agricultural Organiser, Nottinghamshire, "Experiments with Sugar Beet in the Midland Counties"; Mr. C. J. Clarke, Chiselborough, "Practical Experience in South-West England"; and Mr. H. J. Page and Mr. C.

Heigham, "Manurial Experiments with Sugar Beet at Rothamsted and Woburn." Those who can make it convenient to attend and take part in the discussion should notify the Secretary, Rothamsted Experimental Station, Harpenden, so soon as possible. The Railway Hotel and the Old Cock Inn, Harpenden, will be prepared to provide luncheon, price 3s.

**Appointments for the Ensuing Week.**—**MONDAY, JANUARY 10:** United Horticultural Benefit and Provident Society's meeting; Guildford and District Gardeners' Association's meeting; National Chrysanthemum Society's Floral Committee meeting. **TUESDAY, JANUARY**

in some newspaper, to form a collection of types of natural objects, specimens, etc., fitting for museums of natural history; now I take it that, if this plan were adopted in regard to botanical gardens, with much more completeness and care than is shown at present, even in the best of this kind of gardens, it would render them far more useful than they now are. That is, if attention was first directed to the cultivation of types, say, of each genus, and of all plants especially illustrative of particular facts in vegetable economy, and as far as climate and cultivation would allow, systematically arranged, the botanical student would find much more to induce him to visit such collections

FIG. 14.—CHRYSANTHEMUM (POMPON) CAPT. COOK

(See p. 28).

11; Royal Horticultural Society's Committees meet; Jersey Gardeners' Society's meeting; Wimbledon and District Gardeners' Society's meeting. **WEDNESDAY, JANUARY 12:** Burton on-Trent and Shobnall Chrysanthemum Society's annual meeting; Newport (Mon.) Horticultural Society's meeting. **FRIDAY, JANUARY 14:** Orchid Club meeting; Royal Horticultural Society of Ireland meeting; Buxton and District Chrysanthemum Society's annual meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Botanical Gardens.*—Until I saw the Glasnevin and Belfast Gardens, I own I had a very low notion of the value to botany or horticulture of botanical gardens, either at home or abroad; no disparagement to Kew, where the collections, both indoors and out, are extensive and well-kept. I, however, lately read a proposal of Professor Henslow

than he has at present. Of course, I should not confine the collection to such types; there would be many other objects illustrating structure and vegetable physiology, which should find their place in a garden devoted to living specimens of plants; and there should be attached to it a museum similar to that at Paris, and since commenced at Kew, and also a herbarium. I remember a few years ago calling your attention to the subject of botanical gardens, and you then stated your intention of making some observations on the subject. *Dodman, Gard. Chron., January 10, 1852.*

**Publications Received.**—*Nut Tree Propagation*, by C. A. Reed. *Farmer's Bulletin*, No. 1501, U.S. Department of Agriculture, Washington, D.C. *Naturbilder Aus Südwest-China*, by Dr. Heinrich Handel-Mazzetti. Österreichischer Bundesverlag, Wien, Vienna. Price RM. 24.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON, Bletchley Park, Bletchley, Bucks.

**Ventilation.**—Owing to the amount of fire-heat requisite at this season to maintain the necessary warmth, especially in the warmer divisions, it is advisable to admit fresh air daily to prevent a stuffy atmosphere. Discretion must be used in admitting air every day, as a dry, parched, stagnant atmosphere is detrimental to plants at any time. The observant cultivator will soon detect the difference between a badly ventilated and a judiciously ventilated house, not only by his own physical experience, but in the health and vigour of his plants. Houses vary considerably in their requirements in this respect, it being much more difficult in some than in others to maintain that proper balance of heat, air and moisture which is necessary to successful cultivation. Orchids need fresh air but must not be exposed to cold draughts, especially those that have tender foliage, as this is easily chilled and harmed.

**Watering.**—The application of water to the roots at this particular season needs very careful attention. Many Orchids are at rest, and these only require sufficient moisture to prevent shrivelling; others will be growing and require water whenever they become dry. Recognition of this difference is one of the great secrets of successful plant cultivation. A safe rule at this season is to keep the plants somewhat on the dry side until growth or root-action commences, trusting principally to the humidity in the atmosphere to bring them safely through the winter.

**Potting.**—It will probably be found that very few plants are in a desirable condition for repotting, but any that are at a suitable stage for this operation may be attended to at any time provided watering is done carefully until the new roots are re-established.

**Increase by Division.**—Where it is desired to increase the stock of any variety by division, this is best done at the time of repotting, as it can then be seen how to carry out the operation to the best advantage. Every root should be preserved on a divided plant. The divided portions will require careful watering until they start to grow, and are best placed in the smallest receptacles that will hold them.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD WYVETREE, Horley Hall, Grestford, N. Wales.

**Hot-beds.**—If hot-beds for the forcing of early vegetables and salads have not already been made, equal parts of stable manure and leaves should be well mixed together, and thrown into a heap to ferment. Turn the heap after an interval of about ten days to allow the rank gases to escape, and so soon as fermenting materials are in a suitable condition the beds should be formed. Mark out the site of the beds, allowing about eighteen inches more space than the frame will occupy to permit of fresh fermenting materials being added when the heat begins to decline. The bed should be about one foot higher at the back than in the front. Tread or beat the manure firmly, place the frames thereon, and add soil to a depth of about six inches to eight inches. The soil should be light in texture and fairly rich, such as a mixture of old potting soil, leaf-mould, loam, a little old Mushroom-bed manure, burnt refuse, and a dash of soot. The materials should be passed through a sieve to remove the roughest portions. Place a testing peg or thermometer in the soil and so soon as the temperature is suitable a start may be made with the various crops. Should manure be difficult to procure, a gentle

heat may be obtained by the use of leaves, especially if a good bulk be placed in brick pits. It is surprising how long the gentle warmth generated by fermenting leaves will last.

**Carrots, Lettuces and Radishes.**—These vegetables should be amongst the first to be sown. Choose a good forcing variety of Carrot, such as Golden Ball, Inimitable Forcing, Early Nantes or Paris Forcing. The seeds should be sown thinly in rows made eight inches apart. Select any compact varieties of Lettuce, such as Selected Tom Thumb, Commodore Nutt, Harbinger Forcing and Golden Ball. These small-growing sorts need only about six inches to eight inches between the rows. Thin the seedlings at an early stage, leaving them from two inches to three inches apart, and when they are large enough, take out the alternate plants and use them as salad. Presuming a stock of seedling Lettuces is available from seeds sown earlier in boxes, no better place can be found for them than these warm frames. Keep a close watch for slugs. Radishes may be sown broadcast or in rows, the latter method for preference. Good forcing varieties of the Turnip-rooted section will be found the best for earliest forcing. They have small tops, so that a space of four inches to five inches between the rows will be ample.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Figs in Borders.**—Trained Fig trees, established in compartments or cubes of compost should now be ready for starting into growth, by the aid of fermenting material, where this can be done. Later houses, in which the trees are allowed to grow naturally, should be kept dry and cool by the most liberal ventilation, unless the weather is exceptionally cold and frosty, and put in readiness by cleansing the woodwork, etc., also training and top-dressing the trees as may be required.

**Peaches.**—Where fermenting materials have been used for forcing the earliest pot Peaches, the difficulty has been to keep the temperature at 50° at night and 55° to 60° by day. Ventilation should be afforded every day at the top of the house, according to the state of the weather. Maintain a humid atmosphere by turning a portion of the bed and sprinkling it occasionally with tepid water. Allow the buds to get dry before darkness sets in, and, as the blossoms expand, raise the night temperature to 53° or 55°. Allow the flowers to get perfectly dry by the middle of the day, when a brush or rabbit's tail should be passed over them to distribute the pollen.

**Peach Trees in Borders.**—The present is a suitable time to close the first houses of permanent trees containing such varieties as Early Rivers, Nectarine, Duke of York and Peregrine Peaches, if not already done, no fire-heat being necessary for the first fortnight. Let the necessary pruning and top-dressing be attended to in the later houses, and where red spider and scale have been prevalent, cleanse the trees with soft soap and Gishurst compound, used according to the directions issued by the makers. In using the brush be careful to draw it upwards to the point of the shoot. The trees will then be in a thorough state of readiness for starting at any early period of the New Year.

**Strawberries.**—Plants that were placed on a bed of leaves last month will have started to grow, and when the flower spikes are discernible remove them to a shelf close to the roof-glass in a house having a temperature of 50° to 55°. Do not exceed the latter figures until the fruits have set. Keep the plants moderately moist but not wet. Plants for successional cropping should be brought indoors from the open every fortnight. Examine the drainage to see that it is perfect. Every facility should be afforded the grower for syringing to keep down red spider; aphides should be destroyed by light fumigations.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STAFFORD, Wrotham Park, Barnet, Middlesex.

**Red Currants.**—These bushes should be pruned and the ground afterwards forked over and put in neat order. If the plants have reached the height required, all the shoots should be spurred back to within a few buds from the main, cordon-like branches. Do not allow the heads to become crowded with shoots; each branch should be sufficiently far apart to allow light and air to circulate freely throughout the bush. If it is intended to increase the stock of particular varieties, save the best of the prunings for cuttings, and also keep a watchful eye on the buds should sparrows and other birds promise to be troublesome.

**Raspberry Beds.**—The Raspberry needs a deep, fertile soil, moist but not too wet. In preparing the ground for new plantations keep the best soil towards the top and break up the land two feet deep. If the soil is of a poor nature add plenty of rotted manure when trenching it. Heavy land should be lightened with such porous materials as that from the rubbish heap, wood-ash or leaf-mould. In planting in lines make the rows six feet apart and allow six inches between the canes in the rows. Spread the roots out and work plenty of fine soil amongst them, treading the ground rather firmly as the planting is completed. Apply a good mulch of manure a foot beyond the extension of the branches.

**Autumn-fruiting Raspberries.**—These varieties, like the summer-bearing sorts, require liberal treatment. The ground should be dug deeply and enriched with suitable materials. Plant young, healthy suckers forthwith. The old plants should be cut down almost to the ground level each year, and as the new growths appear remove any that are weak and not required for any particular purpose, so that those left to fruit may grow freely and sturdily. The varieties Lloyd George and November Abundance are good and reliable croppers.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN, Brocket Hall, Hertfordshire.

**Chrysanthemums.**—Where large blooms of Chrysanthemums are desired, such varieties as Majestic, Victory, Mr. G. Drabble, Queen Mary, and the sports of the two latter, should now be rooted and ready for placing in small pots singly. These varieties require a long season of growth to produce the best results, while the propagation of most of the others is best delayed until now. Cuttings that have rooted sufficiently should be placed singly in small sixty-sized pots, after which they should be stood on a shelf near the roof glass in a comparatively cool house to prevent them becoming drawn. The soil for this potting should consist of three parts loam and one part leaf-mould, mixed with a little bone-meal, and sufficient sand and burnt garden refuse to render the compost porous. Cuttings of other Japanese varieties, also single and decorative sorts, may now be inserted in sandy soil and stood in a propagating frame. They will root readily in a temperature of 45° to 50°. It is a mistake to root Chrysanthemums in a high temperature for this causes them to grow weak and spindly. Some growers place one cutting in a small pot, but I see no necessity for this, provided where more than one are inserted they are not allowed to remain in the receptacle until the roots have become entangled. Remove the frame every morning to allow the condensed moisture to escape. After the cuttings have been secured many of the old stools may be dispensed with, retaining only sufficient to ensure plenty of stock, and for the later propagation of cuttings in April to produce small plants for growing in six-inch pots for decorative purposes.

**Flowering Shrubs.**—In large establishments where groups of plants are required for decoration nothing gives such good results as flowering shrubs, which are very easy to grow and may be had in flower over a long period. They

include Wistarias, Lilacs, Ghent and Mollis Azaleas, Laburnums, species of Prunus, and Viburnums. When starting flowering shrubs into growth it is not advisable to bring them from the open and place them in a high temperature, for this would only result in failure. There is no more suitable place in which to force them in the early stages than a fruit house that is being closed. The small amount of heat such houses provide is most suitable for flowering shrubs, and their development may be hastened somewhat when it is noticed that the roots are active and the buds expanding freely, by introducing them to a warm house where they may remain until such time as the flowers are developed. When in bloom, they should be stood in a cooler house, but guard against cold draughts, which would cause them to flag considerably.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Verbena venosa.**—This plant is easily raised from seeds sown during this month. It should be more generally used for bedding schemes, as it is very charming when associated with grey-foliaged plants, or with pale yellow flowers, such as those of *Calceolaria amplexicaulis*.

**Foliage Plants from Seeds.**—A large number of foliage plants may be raised from seeds sown at this time; they are of immense value for associating with flowering plants or for use in sub-tropical bedding. They include such useful and beautiful subjects as *Centaurea candidissima*, *C. gymnocarpa*, *C. Clementei*, *Cineraria maritima*, all plants valuable for their silvery or grey foliage; *Solanum marginatum*, *S. Balbisii*, *P. pyracantha* and many others that are valuable for large, bold schemes; *Eucalyptus Globulus*, *Ricinus* (Castor Oil Plant), Maize in green, variegated and quadri-coloured varieties. *Albizia lophantha*, *Perilla* and ornamental Beets. All these most popular and useful subjects are easily raised from seeds sown during the months of February, January and March.

**Lawns.**—The repairing of lawns, where necessary, should, if not already done, be proceeded with as weather conditions permit. Playing lawns especially will need attention now in order that they may be in good condition for use when needed. Worn patches should be cut out and returfed with sound material similar to that removed, while small depressions should be made level by rolling the turf back and placing sufficient soil underneath it to bring the surface to the general level. Where large stretches have to be relevelled the turf should be carefully removed in turves twelve inches square, and the correct levels pegged out by means of boning rods or a straight edge and spirit level. After bringing the ground to the required level, the turf should be relayed by a skilled workman. When in proper condition the lawns should be swept and rolled: the sweeping will distribute worm casts, while the roller will consolidate the surface which has been loosened by frost and worms, but neither sweeping nor rolling should be done unless the lawn is dry, or else much damage may result to the grass. In the case of tennis lawns, bowling and putting greens, worms may be eliminated by means of a worm-destroyer, but in the case of general lawns this is not possible, or, indeed, desirable, except on a small scale. Where it is desired to sow new lawns during the spring, no time should be lost in levelling and preparing the ground, so that it may be in good tilth when the time for sowing arrives. Lawns that are in poor condition will benefit by being raked or treated with a brush-harrow, afterwards top-dressing them with fine soil and bone-meal, or thoroughly decayed farmyard manure, raking it over evenly, or using the brush-harrow in the case of large areas.

**Garden Paths and Drives.**—Any new work and repairing of existing paths should be undertaken when time and weather conditions permit. The work may consist in re-gravelling, correct-

ing faulty drainage, or making good uneven edgings. Even if suitable material is on the spot, path and road making is an expensive operation, but in the end it pays to do the work thoroughly, for with proper attention, well-made paths require little renovation for many years. On sloping ground it is a common mistake to make no provision for the carrying off of storm water, with the result that the material of the paths is being constantly washed down to the lower levels. Much of this trouble may be prevented by fixing suitable gullies and traps for storm water.

**Mowing Machines.**—If not already done, all machines should be thoroughly overhauled and cleaned in readiness for the coming season, replacing worn or broken parts, with new spare parts from the makers. Any machine that requires repairing should be sent to a suitable establishment where such work can be properly done.

they should be removed to temporary quarters, and the house or stove washed thoroughly, including the walls and stagings, and the whole made sweet and clean before they are returned. If inside painting is necessary, this also should be done while the house is empty, so that when the clean plants are returned they will have sweet quarters.

**Hellebores.**—These useful winter-flowering plants are making a fair display, and where hand-lights or sashes were placed over them some time ago, the flowers have been protected from the vagaries of the weather, and also from soil splashings by heavy rains. Clumps lifted for forcing should be watered carefully and hardened gradually again before being replanted. When replanting, take the opportunity of using some of the smaller portions of the plants to increase the stock. A serious disease of the foliage attacked our Christmas Roses a few years ago, the leaves being so severely crippled

FIG. 15.—CATTLEYA WARSCEWICZII VAR. ALBA.

(see p. 26.)

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Seed-sowing.**—Where large Onions are required the seeds should be sown very early in the year in order to ensure as long a season of growth as possible. Sow thinly, and cover the seeds fairly deeply as they have a tendency to work up to the surface, and the resultant growth becomes twisted and recumbent. A moderate temperature is always best for hardy subjects, and little is gained by attempting to force them unduly. So soon as the seedlings appear they should be exposed to the light to prevent them becoming drawn and soft in texture. When the second leaf is well developed prick out the plants singly into other boxes of well prepared soil.

**Plant Houses.**—The various fruit houses having been cleansed and made ready for another season, they should be left fully ventilated, so far as the temporary occupants permit, until the time comes for closing them. Attention should now be devoted to the cleansing of the plant houses. All foliage plants should be sponged with a soapy solution to rid them of dirt and insect pests; where scale insects are troublesome, a wine-glassful of paraffin to half-a-pound of soft soap, well-beaten and emulsified, should be used in tepid water, and the stems and midribs of the leaves carefully gone over with a blunt stick to loosen these troublesome insects. When all the plants have been cleansed

during the growing season as to leave the plants weak and useless. This disease was eventually controlled by spraying the plants with a solution of liver of sulphur at a strength of one ounce in one gallon of water, on two or three occasions throughout the summer.

**Drainage.**—If any draining, either of lawns or other parts of the garden, is contemplated and necessary, arrangements should be made to have this work done in the near future. It sometimes happens that very old drains become blocked and do not perform the purpose for which they were intended. Where this is the case, it may be sufficient to reopen these old drains, and, after clearing the obstruction, simply relay the old tiles, assuming that they have a clear outlet to a main drain. In cases of new drains, it is necessary to draw up a plan showing the whole scheme, and by means of a tripod and level ascertain the lowest point where all the drains must converge, thus ensuring a sufficient gradient to the branch drain. From this point the latter should be led to the nearest ditch or brook with sufficient fall to keep it working freely; the mouth of this main drain should always be kept clear so that on inspection it may be seen at a glance whether it is working efficiently. Land that has been soured and water-logged for years is soon improved beyond recognition by a good drainage system, and lawns that are like a morass in wet weather are rendered firm and dry.

## USEFUL WINTER-FLOWERING ORCHIDS.

THE fortunate possessor of a large collection of Orchids has an available supply of high-class flowers at all times of the year, but the species which flower during the winter months seem to have a double value, and the object of this note is to direct attention to a few of the more easily managed kinds which usually flower during the dull days of winter. Some of these are so extremely beautiful, flower so freely, and are so easy to manage, that each kind should be grown in considerable quantity where accommodation can be found.

### CALANTHES.

The deciduous *Calanthes* are worthy of special mention, for they produce long spikes of showy flowers which remain in beauty for a long period, and they probably rank amongst the most popular Orchids grown. *C. Veitchii*, *C. vestita* and their varieties and hybrids, are the most desirable from the decorative point of view, and as the flowers are borne on very long spikes, after the leaves have fallen, they may be grouped with other plants to produce very pleasing effects. The flowers are also amongst the most useful for cutting purposes.

*Calanthes* succeed admirably in a mixture of turfy loam, Oak leaf-soil, not too decomposed, and dried cow-manure, with a sprinkling of sand or finely-broken, clean crocks. The drainage must be effectual, and as the plants commence to make new growth soon after they go out of flower, repotting should be done before this is far advanced. No water should be given until the roots have penetrated the soil, and then very little until growth is quite active, when liberal quantities and a moist atmosphere will be necessary.

### CATTLEYAS.

The magnificent *Cattleya labiata*, the first *Cattleya* to flower in this country, produces its flowers rather too early, October and November, to be included in the selection of winter-flowering species, yet its flowers are so acceptable at that dull period that it can hardly be left out. Its large flowers, with rose-coloured petals and crimson lip make *C. labiata* very valuable as a decorative plant. *C. Warscewiczii* is also an exceedingly valuable plant and unsurpassed in attractiveness in its season. The variety *alba* (see Fig. 15), with pure white flowers, is equally useful.

*C. Bowringiana* is also a popular species which grows and flowers freely. Although the flowers are small compared with those of the labiate section, they are produced eight or ten on a scape, and their rose-purple petals with veins of a deeper tint, and deep purple lip, make them attractive. The plants succeed in a house having an intermediate temperature and they should be given the advantage of a light position near the glass, with sufficient shade in bright weather, during the summer season, to prevent the leaves receiving any injury from the sun. A mixture of *Osmunda* fibre and Sphagnum-moss suits them admirably and the pots should be filled to at least a third of their depth with rather large crocks.

*Cattleyas* must not be overwatered at any period of their growth; when growing freely they require moderately liberal supplies, but when at rest only just sufficient water should be given to keep the pseudo-bulbs from shrivelling.

### COELOGYNES.

Several species of this genus flower during the winter months, but none can compare with the lovely *C. cristata*, one of the most beautiful of all East Indian Orchids, and one of the easiest to manage in an ordinary plant house. The flowers are large, graceful in form, and of the purest white, with orange-yellow markings on the lip, and they are produced profusely in long, pendent racemes.

Baskets or shallow pans are the best receptacles in which to grow this species, and as it requires an abundance of moisture at the roots during the growing season, they should be half-filled with crocks. *C. cristata* grows freely in a mixture of fibre and Sphagnum-moss, with a plentiful addition of small crocks and charcoal

nodules. As the pseudo-bulbs lay almost flat upon the material, this should be raised in the middle into a convex outline. During the flowering period cool treatment and a comparatively dry atmosphere will be found most congenial to the plants, and under such conditions the flowers last quite a long time.

### CYPRIPEDIUMS.

There are many useful species of *Cypripediums* for winter-flowering, but for the easy production of flowers in quantity there is nothing to beat the old *C. insigne* and its many varieties. This may be grown very successfully in an ordinary greenhouse, but the progress will be more rapid and the flowers more freely produced if the plants are subjected to a higher temperature during the time the young growths are being made. *C. villosum* is also a handsome species of robust habit and strong constitution, but requires a stove temperature during the season of growth.

A compost of two-thirds fibrous peat and one-third Sphagnum-moss suits these plants well and, when potting, ample drainage should be given. They require liberal supplies of water when in full growth, and as they have no pseudo-bulbs to support them the compost should not be allowed to become dust-dry when they are at rest.

### DENDROBIUMS.

Probably the two best species to cultivate for winter-flowering are *D. nobile* and *D. Linavianum*, both of which require the warmer end of a stove. *D. nobile* is one of the oldest and best-known, very easily grown, and, moreover, one of the most beautiful and floriferous species, in cultivation. Some growers may object to its inclusion as a winter-flowering species as its natural season is spring, but it is an accommodating plant, and with special management may be had in flower in February. To effect this, the plants should be placed in strong heat early in the year and encouraged to make their growth early. So soon as this is completed they should be removed to a cooler, airy position, exposed to the light and sun and kept comparatively dry at the roots to compel early rest. By placing these plants in a brisk temperature early in the winter they will start away freely and soon come into flower. The following season they will start into growth naturally much sooner than usual, and every encouragement should be given to induce them to complete it quickly. By dividing the plants into several batches it is possible to have flowers over a very considerable period.

The essential points in the cultivation of *Dendrobiums* are a light material, such as Sphagnum-moss and fibre for the roots to run in, a brisk temperature combined with a humid atmosphere, and liberal supplies of water when in full growth, also a light and airy position when the season's growth is in process of maturation, combined with dryness both at the roots and in the atmosphere. They should not be overpotted as they flower more freely when they have not too much fresh material about them.

### EPIDENDRUMS.

Most of the members of this genus produce their flowers in spring and summer, but *E. Lindleyanum* flowers in late autumn, and *E. Skinneri* major is a valuable winter-flowering kind which merits attention because of its ease of culture and free-flowering qualities. It thrives in an intermediate temperature, suspended near the roof-glass, and should be grown on blocks of wood or cork. The plants require an abundance of moisture during the summer season and sufficient to preserve the pseudo-bulbs plump during the winter. They should not be exposed freely to the sun until the month of August, when the power of its rays has declined.

### ONCIDIUMS.

There are several *Oncidium*s which are valuable winter-flowering plants, and amongst those which can be most highly recommended are *O. flexuosum*, with large, branching spikes of bright yellow, showy flowers; *O. leucochilum*, an old favourite of good habit, very strong in growth, and producing immense quantities

of yellow and brown flowers when well grown; *O. ornithorhynchum*, producing graceful, arched scapes of delicate, rose-purple flowers, delightfully scented; and *O. tigrinum*, a most beautiful free-flowering species. This is a most useful plant, its blossoms developing in late autumn and winter, lasting for several weeks in perfection and filling the house with a delightful Violet-like fragrance.

These *Oncidium*s thrive in a cool house and may be grown in pots or baskets; they should be kept near the glass at all times. They prefer an open compost, and when the plants are growing freely supplies of water must be liberal, but it is desirable to keep them rather dry at the roots when at rest.

### LAELIAS.

This genus provides two extremely useful winter-flowering plants in *L. anceps* and *L. autumnalis*. The latter, with its varieties, ranks with the most select of *Laelias*, grows and flowers freely in the Mexican house, and is of exceptional value because its fragrant and lasting flowers expand in October and November. *L. anceps* is a vigorous growing species, and flowers freely in December and January. It succeeds well in baskets, and large specimens of it are remarkably handsome, frequently producing so many as twenty scapes of its fragrant, richly-hued flowers.

### LYCASTE SKINNERI.

This splendid Orchid is of especial value because of the ease with which it may be grown in a cool house. It succeeds satisfactorily in a temperature of about 55° during the winter season. The plants should be potted in a compost of fibrous peat and chopped Sphagnum-moss, and receive abundance of water during the growing season, but only a moderate amount during the winter. As with all moisture loving subjects, drainage must be perfect.

The scapes, which spring from the base of the pseudo-bulb, are single-flowered, but they are freely produced, and the flowers are large and strikingly handsome. When fully expanded great care must be exercised to prevent the flowers being wetted or they soon become spotted and unsightly.

### VANDA COERULEA.

This, the last subject to which I intend to allude, is a very distinct Orchid, and from a decorative point of view, one of the most valuable, while in colour, as well as in wealth of flowers, it is supreme amongst *Vandas*. To cultivate it successfully it should be kept in an intermediate house or in the cooler end of an ordinary stove, as too much heat is decidedly injurious to it. It thrives in Sphagnum-moss with which a plentiful proportion of clean potsherds and charcoal nodules is mixed, and should be grown in baskets suspended from the roof, where it may have abundance of light and a free circulation of air. It should be shaded only during the hottest sunshine. The flowers are of a beautiful pale, lavender blue, and are borne on racemes produced from the axils of the leaves. Generally, only two racemes appear in one year, but occasionally, under good cultivation, three, four, or even five racemes may be produced, and when the flowers are all expanded it is a gorgeous sight not easily forgotten. A. P. C.

## ORCHID NOTES AND GLEANINGS.

### SCALE INSECTS.

ONE of the worst pests of Orchids is a soft, white scale that conceals itself under the outer sheaths of the pseudo-bulbs of *Cattleyas* and similar plants.

The destruction of scale insects may be accomplished with the aid of one of the many safe insecticides sold for the purpose, mixed according to the instructions given by the makers, with tepid, soft water. Sponge the leaves and pseudo-bulbs, and where the pests are very numerous, the outer sheath may be opened and the scales removed with a pointed stick. Where a number of plants require cleansing.

time will be economised by preparing sufficient of the insecticide in a tub or other convenient utensil, to immerse each plant head downwards in the specific, well wetting the leaves and pseudobulbs. After withdrawing the plant, hold it over the tub to drain for a short time, and place it on its side; following this the plants should be thoroughly examined and cleansed.

Take the opportunity to wash the pots and the material on the stages, also remove all dirt from the glass, roof-rafters and other woodwork of the house. C.

## INDOOR PLANTS.

### BOUVARDIAS FOR WINTER DECORATION.

ALL who have to provide a large supply of flowers during the winter should grow these splendid plants, for few other subjects give such a wealth of blossom during the short, dull days, when well grown. But Bouvardias, to be worth house room and a credit to those who grow them, must be well cultivated, and cultivation means potting them in a generous compost, hastening their development in a growing temperature during the early part of the season, and then placing them for the summer under the most favourable conditions for making vigorous growths early enough in the season for them to become thoroughly ripened by the end of the summer.

For the production of good plants, a start should be made in January, or so soon as cuttings are obtainable. These should be struck in the propagating case, and when well-rooted placed singly in three-inch pots. They should be grown in an intermediate house or warm corner of the greenhouse, giving them full exposure to the light. So soon as well established in these pots they should be shifted into five-inch pots, the object being to keep them growing vigorously until all danger of frost is gone, when they may be planted outside. Herein lies the most important point in the culture of these plants, for when kept starved in small pots they make hardly any progress until they are planted out, and what little growth is made is very weak. It is not, however, of so much importance to shift them for the sake of the actual growth made in the pots, as it is to prepare them for growing away in the most vigorous manner when turned out into the border. Stunted plants require considerable time to recover from the effects of the starving process to which they have been subjected, and our summers are so short for the growth of these plants that every precaution must be taken against losing a single day.

The preparation of the compost is a matter requiring some judgment. It should be moderately rich and rather light in texture: a mixture of three parts fibrous loam, two parts old hot-bed manure, and one part Oak leaf-soil with a liberal sprinkling of coarse sand suits them admirably, while for the autumn potting a little bone meal may be added.

Early in June, Bouvardias may be planted out on a warm, sunny border, which has been well prepared, at a distance of about fifteen inches apart. A liberal supply of water on a few occasions will be required until the plants have become well established in their new quarters, and occasional waterings throughout the summer in dry weather are necessary. To ensure the formation of bushy specimens, the growths should be pinched on two or three occasions during July and August and no flowers should be allowed to develop, while the final pinching should be made not later than the end of August.

At the beginning of September the plants should be lifted carefully with balls of soil and put into pots of a suitable size, i.e., as small as practicable, while large enough to take the ball without injury to the roots. After they are potted, place them in a cold frame and keep the latter close for a few days to favour new root action. They will soon be able to bear exposure to the air again, and during the rest of the month they may be fully exposed to the sun's rays to ensure perfect ripening of the wood. At the end of that month they may be removed

to the greenhouse or intermediate house, where they will soon begin to produce their beautiful flowers in rich profusion.

Bouvardias are liable to be attacked by aphids and thrips which may be kept in check by periodical fumigations. They are also subject to the attack of red spider, hence, when housing the plants it is good practice to stand them on an ash or shingle base which can be kept moist, to prevent the atmosphere becoming very dry.

There are both single and double varieties, and amongst the most desirable singles may be mentioned *jasminiflora* and *candidissima*, pure white; *Dazzler* and *Hogarth*, scarlet; *President Cleveland*, crimson; *rosea oculata*, delicate pink; and *The Bride*, bluish-white. The best doubles are *Alfred Neuner*, white; *Hogarth fl. pl.*, scarlet; and *President Garfield*, pink. W. Auton.

*Primula Parryi* is the largest and showiest of the United States species, and perhaps of all American ones, although it is rivalled by an Alaskan plant. It was named after Dr. C. C. Parry, one of the early botanical explorers of the Colorado Rockies, who was also the first botanist of the United States Department of Agriculture. It is a species of restricted distribution, confined to the high mountains of Colorado and to the ranges of northern New Mexico lying between Las Vegas and the historic city of Santa Fé.

In the latter mountains, where I have seen the plant in some abundance, it grows mostly at altitudes of 9,000 to 11,000 feet, usually in wet, boggy places, surrounded by forests of Colorado Blue Spruce (*Picea Parryana*), Fir (*Abies concolor*), and Douglas Fir. Although rather widely distributed here, it is seldom one finds more than a few plants

FIG. 16.—PRIMULA PARRYI.

Photographed at Lake Peak, near Santa Fé, 11,800 ft. alt., August 1, 1926.

## PLANTS NEW OR NOTEWORTHY.

### PRIMULA PARRYI.

FROM all North America only twenty species of *Primula* are known, a number that compares very unfavourably with the vast representation of the genus in the mountains of China. Even these twenty species are confined for the greater part to the arctic regions of the North American continent, several being unknown outside Alaska. Most of the few species which do extend to the United States are either rare or inhabit localities difficult of access; none of them grows in the more densely populated regions, hence most Americans pass their lives without ever having seen a *Primula* growing wild.

Several *Primulas* are native of the Rocky Mountains, nearly all of them plants which exist only in the higher and less frequented parts of the mountains, usually above or near the timber line. The genus extends southward in the Rockies so far as New Mexico, and from this state four species are known, all of them confined to very limited regions.

in a given locality. Often they develop luxuriantly in the wet patches of soil just at the edge of the snow banks, which linger on these southern peaks until late August. With golden alpine Buttercups and the delicate bluish chalice of the Elkslip (*Caltha leptosepala*), the Parry *Primula* often forms fine masses of colour. It is probably too gaudily coloured and too rank in growth to find favour with English gardeners—to whom it appears to have been introduced in 1875 (see *Bot. Mag.*, t. 6185)—but in its natural surroundings it is very beautiful indeed. *Primula Parryi* is a vigorous plant, usually twelve inches to eighteen inches high, with lush, bluish-green, smooth leaves, above which rise the large umbels of bright, reddish-purple flowers.

The illustration here reproduced (Fig. 16), is from a photograph by Mr. Frank H. Shoemaker, of Lincoln, Nebraska—who has made excellent photographs of many other New Mexican plants—and gives an accurate idea of the appearance of this Primrose in its natural habitat. The photograph was taken on Lake Peak, New Mexico, August 1, 1926. Paul C. Standley, U.S. National Museum.

## CHRYSANTHEMUMS IN AMERICA.

ACCORDING to local authorities, the season of 1926 was an unusually cool and damp one, and these conditions encouraged the attacks of certain insect pests and other Chrysanthemum troubles. Certain varieties that are easily affected by excessive moisture suffered rather badly. The general results, however, were beyond my expectations.

The earliest varieties are planted about the middle of May, and other batches follow more or less in their order of flowering, until the third week in June. Those that flower for the Thanksgiving trade, and the Japanese sorts, are the last to be planted. After planting, they make rapid growth until the heat becomes excessive, and this is the period when the anxieties of the growers begin. With the hot weather come swarms of grasshoppers of all sizes, mostly much larger than those we are used to in England. The young growths suffer badly from the ravages of these pests, which feed on the top few inches of the stem and so ruin the buds. To ensure a crop it is almost essential to leave two buds where one flower is required; not that the grasshoppers will eat one and leave the other, but this gives the plant a double chance—alas! in many cases a double feast for the pests! Leaf-rollers are another great trouble out here. Arsenate of lead and lime are dusted on the foliage to help check the invaders, but this dusting is, I think, bad for the plants, and if used very often may contaminate the soil and so do harm to the roots. This is mere conjecture, however, as I have no proofs that it is so. Fumigation with nicotine or cyanide gas may help to kill some leaf-rollers, but as cyanide burns so many varieties it has to be used with the greatest of care or much damage results. The members of the Turner group seem particularly susceptible to injury from cyanide fumes. The results of the grasshoppers' visits are most evident on the earliest varieties.

It is surprising to the inexperienced how well the plants flower after being in such an apparently bad condition through August. After the heat of the summer it is little wonder that the plants should not look so good as those grown out-of-doors in England.

The first varieties to flower are Early Frost (white), and Yellow Early Frost. The buds of these are taken about the first week in July and flower at the end of August and the beginning of September. There are no varieties flowering so early that can compete with these two very good sorts. Both have been tried in England but with little success. After the White and Yellow Frosts are over there is a short time before the midseason varieties are ready. These seem to suffer most during the hot weather and consequently seem to make the most headway when conditions begin to improve.

I shall not attempt to describe all the commercial varieties grown out here, but just give a few notes on those that have struck me as being outstanding in their particular classes.

The best yellows in the decorative class are: Sunglow, Chrysolora, Golden Glory and Adrian's Pride. The first is by far the best variety, flowering towards the end of October; Chrysolora and Golden Glory flower at the same time and are both very good but not quite up to the quality of Sunglow. So far as I know, Sunglow has not been tried in England; it is a large-flowered, incurving variety of a good, rich yellow colour. I have seen Adrian's Pride at home, but it was not nearly so good then as I have seen it in America. One batch that I saw flowering for the Thanksgiving trade was as good as any variety I have seen. It was worth going a long way to see.

Two pinks by which I have been very much impressed are Angelo and Thanksgiving Pink. Angelo is a good pale pink variety flowering in early October. In form it is a perfect ball, but not incurved. It is one of the few disbudded varieties that are grown to carry more than one flower per plant—twelve flowers develop perfectly. Thanksgiving Pink, as its name implies, flowers for Thanksgiving Day (November 25). This does much better out here than it did when I saw it in England. It is a good, deep pink colour—not a shade that

I favour myself, but a good selling colour at its date of flowering.

Mariana, white; Cheftain, Favourite, Monument and Timothy Eaton are the best whites I have seen here. Mariana is called a "Pompon" but as it carries several flowers to the plant, which are each four-and-a-half inches across, it would not be classed as such at an English show. It is pure white and of the same form as Angelo. White Cheftain and Favourite hardly need any description. Of the two, I think White Cheftain is the purest white, and has flowers of the best quality. I saw them both flowering about the middle of October, 1926. Timothy Eaton is the favourite white variety for Thanksgiving, but it did not impress me as an outstanding sort, but one could not pass a bench of Monument without stopping to admire the wonderful size and form of its pure white, incurving flowers. It is a variety of really wonderful qualities and at its best about the middle of October.

The only variety of any other colour worthy of special attention is Harvard. This is a crimson of very good quality. In form it is perfectly reflexed and has a good, clean habit of growth.

All the foregoing are grown on raised benches, and, with the exception of Mariana and Angelo, only carry one flower to the plant. The usual spacing is from six inches by eight inches to eight inches by ten inches.

The Japanese varieties I do not wish to compare with those grown in England as they do not appear to be at their best when grown on benches; indeed, it seems impossible to get the conditions just right to give the real good finish that is possible under pot culture. I would rather have a bunch of out-door spray blooms than half-a-dozen badly finished Japanese flowers.

Many English Japanese varieties are standard sorts out here, R. Pulling, Mrs. G. Drabble, white, pink, bronze and yellow Turner, Earl Kitchener, General Allenby, Lady Hopetoun, Louisa Pockett and its yellow sport, Majestic and Mrs. Chas. H. Curtis, all do quite well. I think Majestic is the best of these when grown on benches. Of the newer varieties, Nan Luxford, Mrs. T. W. Pockett and Sulphur Queen I have seen in quite good condition. Phoenix should do well as an early spray variety.

Undisbudded Pompons are much more popular with American growers than they are in the Old Country. I am surprised (if the true Pompons will do as well in England as they do in America) that they are not more largely grown for the out-door flower trade. The name "Pompon" embraces all sizes from varieties like Candida down to the small Pompons, such as are grown in England; in fact, any variety that can be grown in spray form is called a Pompon in America. The following varieties are the best of the true Pompons that I have seen so far: New York, golden bronze; Bronze Queen, Snow Bank, Claret, Coquette, pink; Ida, yellow; Flora, crimson; Hilda Canning, brilliant bronze; and Capt. Cook, pink (Fig. 14).

It is difficult to compare the American and English results owing to the vastly different methods of cultivation. Where one tries to get as many good flowers on a plant as possible and give plenty of room at home, in America growers want one good bloom to a plant, but as many plants as possible in a given space. I think that the best flowers in both countries are just about on a level with each other, although this observation applies to the decorative section only. I am proud to think that, with all due respect to our American friends, the English growers are ahead of them in the cultivation of large blooms. I must admit that in England there is not the hot, dry summer to contend with, but one may find perfectly good arguments in favour of the growers on both sides of the Atlantic. To-day, November 25, is the first dull, wet day we have had for some time; it is the sort of weather English growers have to put up with from the middle of September until the end of the season.

As these notes are written by one who has only seen the results of one season's cultivation in one district of the central States, I hope the American champions will not be too hard in their criticisms of them. *Junior Grower.*

## HARDY FLOWER BORDER.

### TWO TALL RUDBECKIAS.

RUDBECKIA laciniata and R. pinnata are two tall Rudbeckias suitable for planting in the back of herbaceous borders. Both are perfectly hardy and most accommodating plants, and when they have grown into good sized specimens make an effective display with their yellow flowers.

R. laciniata has lacinated foliage and large, yellow blooms. It is an excellent border plant and its cultivation presents no difficulty in any good garden soil.

R. pinnata (syn. *Lepachys pinnata*) has more pinnate foliage and distinct flowers. These, like those of R. laciniata, are large, and the ray florets of a good yellow. The disc in the centre is, however, dark coloured, so that the two species may well be grown in the same border. In planting a large border with small plants, three may be placed about nine inches or a foot apart, and they will give a better appearance for the first few years and form a good group more rapidly than a single large plant. Both these Rudbeckias may be raised from seeds, sown preferably under glass, or they may be increased by division. *S. Arnott.*

## ALPINE GARDEN.

### SEDUM SPATHULIFOLIUM.

This Sedum, planted freely, is a plant of much beauty, and when it is on the rock garden, it produces a striking effect; the cushions of opalescent, grey foliage are surmounted by golden flowers on terminal cymes, forked and branched, and not the least attractive feature of the plant are the yellow flower stems with pinkish bases. The variety *purpureum* has plum-purple leaves with a grey bloom and it is possibly the finest Sedum in cultivation, at any rate, as a rock garden plant.

These Sedums grow from four inches to six inches high and have semi-procumbent stems; the type was introduced from North-West America in 1873. *Ralph E. Arnold.*

### SAXIFRAGA FLORULENTA.

SAXIFRAGA florulenta belongs to a special group, the Florulenta in the section *Tristylis* and is confined to a small area between the Col de Tende on the east, to the Tinée Valley on the west, and from the Stura Valley on the north to the Var Valley on the south (about fifty square miles). It is found nowhere else, and grows there between 6,000 to 9,000 feet altitude, always on the hard granite and in very narrow fissures, facing north, east or west, but never south.

The plant is monocarpic (it dies after flowering) but can become very old. I once found an old plant more than a hundred years old, fallen from the wall where it flowered. As the plant gives every year only one verticil of leaves (these being pressed very closely together) it is easy to see that when a specimen has stems two feet long and many thousand leaves, it is very old.

The rosette is dark green, shining, covered with a light film of resinous, aromatic varnish, and strongly ciliate. It seldom flowers, and then, just like *S. mutata* or *S. longifolia*, it dies. The flower stem is one foot or more long, leafy, gelatinous and covered with short pink hairs, as are all the branches and the flowercups; the flowers, as the name indicates, are very numerous, relatively big, disposed in a more or less long pyramid of pink petals, lighter in colour than those of *Saxifraga oppositifolia* and nearer to the colour of the *Megasea* or *Bergenia* *Saxifragas*. They display their remarkable pink, floral pyramids against the dark walls in the highest parts of the Maritime Alps in the months of August and September. As they flower so late their seeds ripen in late autumn, and it is necessary to go there during the hardest frost to collect them. Seeds provide the best means of raising these very difficult plants.

# THE GREAT TOMATO

for 1927

## "CLIBRANS' VICTORY"

A cross between Bide's Recruit and Sensation and undoubtedly the finest of all tomatoes grown to-day. It is an enormous cropper, producing smooth fruit of perfect shape and colour. Every season it is grown in increasing quantities by private and market growers alike; a sure criterion of its excellence.

*A Customer writes:*

"I have no hesitation in saying that your 'Victory' Tomato is the best I have ever grown. I regret you are unable to see them before we gather too many from them. I have plants seven feet high carrying nine trusses all good; on one of these I counted twenty-six fruits and consider the weight on this truss to be over three pounds."

*Another writes:*

"I have a wonderful crop of your 'Victory' Tomato. I have gathered stones of fruit, and on thirty plants there must be quite ten stones hanging now. I never saw a Tomato to equal it."

Per packet 1/6, post free.

**AUSTIN & McASLAN**

The Premier Scottish Seedsmen since 1717

89 MITCHELL STREET, GLASGOW, C.1

Mr. E. Boissier had in his wall at Valleyres some young plants of it and one flowered in the year 1876; but it is rare that transplanted examples flower in the garden; seedlings are better. But how difficult! They are really calcifuge, and want pure peaty soil with sand. We grow it here in a granitic wall facing north, but it has not flowered at Floraire. We wait with patience, however. *H. Correron, Floraire, Geneva.*

## TREES AND SHRUBS.

### SPARTIUM JUNCEUM.

EVERY gardener worthy of the name has a weakness for particular plants, and if he be wise, does not bother over much in justifying his prejudice. I myself confess to an extraordinary liking for *Spartium junceum*, a note on which appeared in the issue for November 27, 1926. I like it primarily because it is an unfailingly good doer with me. It does not die out in the course of a few years. Nor does it grow straggly. Of seedlings raised a few years ago, some are now shapely, compact bushes, six feet high and nearly three feet through. The honey scent of the flowers is delicious, and the plants remain in bloom for nearly three months.

*Spartium junceum* is, in my experience indifferent to soil, does even better in a heavy than in a light loam, and the plant has the final merit which all busy gardeners appreciate, that it can hold itself up against winds without the aid of a stake; altogether, *Spartium junceum* is, I maintain, a first-rate garden plant, adding grace to the shrubbery, but looking perhaps at its best over-topping a terrace wall. *K.*

### HYBRIDS OF SALIX BABYLONICA.

THERE are many weeping trees on the Surrey and Middlesex sides of the Thames, and in other parts of Surrey, away from any river, that pass for *Salix babylonica* or the Weeping Willow. Most of the trees are tall and of considerable age, judging from the thickness of the trunk, so that their source of origin cannot be guessed. The lowest trees that have come under my notice are *S. babylonica* × *S. fragilis*, and though they are distinctly pendulous in habit, they lack the very long, slender branches of another hybrid with weeping branches. The leaves of the first are quite smooth, as might be expected from the parentage; but the serratures are larger than those of *S. babylonica*, and irregular in size and spacing, as in *S. fragilis*. The fruits are also stalked as in the latter. This tree was named *S. blanda* by H. J. Andersson in 1863, and the discoverer, Clemenson, gives its habitat as Germany. The other hybrid is *S. sepulchralis*, and was first described by Simonkai La, in new plants of the Flora of Hungary. The parentage was *S. alba* × *S. babylonica*, and the influence of the first named parent may be seen in the silky hairs upon both sides of the leaves that persist till October, perhaps till the leaves fall. The tree is a very tall, handsome weeper, with long, slender branches, reaching almost to the ground. It was first described in 1890. *J. F.*

### CISTUS LADANIFERUS.

We grow in a hot and sunny place at Floraire the best of all the *Cistus*, I think; I mean *C. ladaniferus*. The plant has been twenty-four years in the same place and is now a shrub five feet to six feet high. The leaves are large and evergreen, resiniferous, covered with a glutinous and strong smelling gum, and on hot days, when the sun is bright, the odour of the shrub reaches the end of our garden; even in winter time one is sensible of the fragrance.

The flowers are as large as those of a wild Rose, white, with a rich brown spot at the base of each petal; they last only half-a-day or, if the weather is not too hot, until four or five o'clock in the afternoon. But they are very showy, and from May to July they make a brilliant display.

Curiously, we never could succeed to rooting cuttings of *C. ladaniferus*, and it never seeds here. We are obliged to get seeds from the south where the plant is not common at all. Once,

I drove through the Esterel, coming from Grasse to Fréjus and was arrested by a beautiful, strong scent that I recognised as emanating from *Cistus ladaniferus*. I stopped and found not far from the road, a large group of this marvellous plant, the seeds being just ripe.

It is said that oriental folk are very fond of the scent of this *Cistus* and make with it the famous perfume called "labdab." *Henry Correron, Floraire, Geneva.*

### RUBUS GIRALDIANUS.

Of the several species of *Rubus* cultivated for the attractive appearance of their stems during the winter, this is undoubtedly one of the best. The stems are remarkably white, equalling in this respect those of the much better known *R. biflorus*.

The arching, branching stems give to the plant an exceedingly graceful habit.

Although an easy subject to grow, it responds

supply of young wood to develop and mature for the next season.

The flowering shoots offer good material for cutting, the flowers opening freely in water in a warm room, and they last a considerable time. As the plant is bare of leaves when in flower, sprays of the common Barberry or *Berberis stenophylla* may be used with the cut branches in vases. Even if the first flowers are spoiled by frost, the remaining flower buds soon open on the return of more genial conditions.

Propagation is easily affected by cuttings: old plants develop roots at the ends of the shoots when they rest on the ground during wet seasons, and these rooted growths offer another means of increase. *R. F.*

### AZALEA GLORY OF LITTLEWORTH.

THE very beautiful flowering shrub known as *Azalea Glory of Littleworth* is a hybrid between

FIG. 17.—AZALEA × GLORY OF LITTLEWORTH.

well to good cultivation, and succeeds best in good loam that has been well worked; a mulching of decayed manure, annually, considerably increases the vigour of the plant. It is essential that the previous year's stems should be removed entirely so soon as they have flowered and fruited, leaving only the current year's shoots. *T. H. Everett.*

### JASMINUM NUDIFLORUM.

This lovely Chinese shrub was introduced in 1844, and is well-known throughout the country. It was in bloom a few days earlier this season, which might be accounted for by the mild, open weather of the past autumn. It is a shrub that should be planted in various aspects: even in the north it will flower in the depth of winter. It is probably seen at its best when it adorns the walls of a thatched cottage by the wayside, or in a snug nook in some old-fashioned garden. The thin growths give the plant a graceful habit and they should not be trained tightly but allowed to droop naturally. The flowers are produced on the young wood, and pruning consists in removing the old flowering shoots and weak wood immediately the flowering season is over, to encourage a plentiful

an *Azalea* and a *Rhododendron*. It has *Azalea*-like flowers of creamy white, blotched with orange. The leaves are lanceolate, short-stalked, and wrinkled. This fine subject received the R.H.S. Award of Merit on May 23, 1911, when exhibited by Miss Mangles. The plant illustrated in Fig. 17 was exhibited by Mr. Lionel de Rothschild (gr. Mr. A. Bedford) at the Special Rhododendron Show held in the R.H.S. Hall on April 27, 1926, and was a noteworthy plant in a noteworthy exhibit.

### PRUNUS SUBHIRELLA VAR. AUTUMNALIS.

This small, deciduous tree is one of the most interesting of its family as it opens its first flowers during November and December and continues to give a few blooms during mild weather all through the winter. It is at its best during March and April.

Although the flowers are small and pale-coloured compared with those of many other species and varieties of *Prunus*, it makes an attractive small tree or shrub, with its twiggy, erect branches, covered with pale, rose-coloured flowers, which, with age, change to white. *F. W. G.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the **PUBLISHER**; and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the **EDITORS**. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## GREEN MANURING.

**DURING** December last, a Conference was held at the Rothamsted Experimental Station on the subject of "Green Manuring: its Possibilities and Limitations in Practice." Although the subject was discussed mainly from the agricultural point of view, the scope of the papers and of the ensuing discussion was wide enough to merit attention by the horticulturist as well as the agriculturist.

Few will dispute that dung is the best all-round source of the organic matter needed in all soils, but, unfortunately, dung is often very difficult to obtain in sufficient quantities and at a reasonable price, especially for the grower who keeps no stock and is therefore entirely dependent on outside sources. Green manures offer, in such cases, an attractive alternative source of humus for the soil.

That green manuring is capable, under favourable circumstances, of bringing about notable crop increases, is shown by the experiences cited by several of the speakers at this Conference, and by a number of accredited experimental results, some of the most striking of which were quoted by Mr. H. J. Page, Chief Chemist at Rothamsted. One such experiment was carried out by Mr. Page when he was chemist at Wisley, which demonstrated clearly the beneficial results obtainable by green manuring on a light soil. Market garden soils are predominantly of the lighter sort, which stands in special need of an ample supply of humus. However, although the horticulturist is thus perhaps specially marked out as likely to benefit from the successful use of green manures, his circumstances are also such as to aggravate the practical difficulties in the way of such successful use. This side of the subject received much attention at the Conference.

The widest and most intensive employment of green manuring demands the coexistence of several factors: favourable climate, reliable seasons, and uniform soils and cropping. All of these obtain in the tropics, but in this country they are conspicuous by their absence. The great variations in soils and cropping, together with the necessity that green manure crops must be produced without disturbance to those main crops on which the grower depends for his income, make the problem of the more extended use of green manures in this country a very local

one. The exact procedure to be followed can be determined only in close relation to the actual conditions of the district and the circumstances of the grower. This is true of the farmer, and it is still more true of the horticulturist, whose systems of cropping are more varied and more intensive, so that he is usually still less able to spare any time for growing a non-marketable crop, or to risk the loss of a marketable one. This aspect of the subject received attention in an interesting paper by Mr. H. Mattinson, Agricultural Organiser for Surrey, a county with a considerable area of market gardening, as well as a large residential population and many small gardens. In one respect the market gardener is perhaps better situated than the farmer to practice green manuring: he grows more special crops that come off the ground early in the season, so that there are more opportunities for sowing a catch crop under favourable growing conditions, for digging in later, if the land can be spared. An example of this is the practice, favoured in some parts of Surrey, of sowing Tares and Rye, or Mustard, after early or second-early Potatoes.

FIG. 18.—*PRUNUS SACHALINENSIS*: AN ANCIENT SPECIMEN ON THE CHUZENJI ROAD, JAPAN.

(see p. 31).

The possibility of profitably using green manure can be decided only by careful attention to the actual circumstances in each individual case, but the system is one with such attractive features that it deserves the careful consideration of all gardeners, private or commercial. The Rothamsted Conference has served a useful purpose in summarising existing knowledge and experience on the subject, and it is satisfactory to know that a full account of the proceedings, both papers and discussion, is to be published in pamphlet form.

## A PLEA FOR NEW EARLY TULIPS.

A CENTURY ago it would not have proved difficult to find enthusiasts in all parts of the country intent on raising new varieties of Tulips. Perhaps the zenith of enthusiasm was reached some twenty-five years later. So well did our forbears labour that few, if any, improved early-flowering or florists' varieties have found a place in commerce during the past fifty years or more. One might even go further than this and assert that some, if not most, of the early-flowering varieties which are now

counted among the most popular, have not been raised during the last hundred years! Why has there been no progress for so many years with the useful "earlies" and their more magnificent relatives the "Florists"? They occupy a place in floriculture for which no substitute is to be found.

There was a period between the years 1860 and 1890 during which the culture of Tulips was sadly neglected, and it may be supposed that succeeding generations of gardeners have never seriously taken up the thread of progress from the point where their grandfathers laid down their task. It cannot be argued that the highwater-mark has been reached, for there are yet wide fields of possibilities that have never been explored. The introduction of those magnificent species *Tulipa Greigii* and *T. praestans*, together with a number of others, such as *T. persica*, *T. Kaufmanniana* and *T. Eichleri* from Turkestan and the Ural regions seem to afford wide opportunities of progress, particularly as their flowering season synchronises with the date of the existing early-flowering kinds, but there is little evidence of serious effort having been made to take advantage of this new blood.

A serious pitfall for the experimentalist lies perhaps in the fact that a number of these species produce very few offsets, while some do not appear to give any at all. This feature might well be transmitted to their offspring.

A hopeful line of quite modern progress is the crossing of the very early Duc van Thol with Darwin varieties, resulting in early-flowering Tulips of Darwin vigour and length of stem, among which are to be found a number having colour and quality of quite exceptional merit. These are known as Mendel's Tulips, and the varieties Amidonette, April Queen, Early Beauty, Lilaran, Oranja and Salmoran may be noted as the best amongst the first dozen of this class offered for sale.

New interest was created in Tulip culture by the introduction of Darwin Tulips by Mr. Krelage in 1889. Their origin is something of a mystery, in regard to which Mr. Krelage steadfastly refused to afford any light. The form and quality of Darwin Tulips, no less than the fact that the first varieties were followed by a rapid succession of flowers of similar type, bear evidence that they were the product of many years of careful cultivation and selection in a direction which was at that date entirely new and unorthodox. The introduction of these new May-flowering Tulips in place of the older April-flowering, bedding varieties, and the natural scarcity of stocks in the early years after their introduction, caused attention to be given to other late-flowering Tulips—the unbroken "breeders" and discarded seedlings and "breaks" which florists had hitherto rejected for the reason that they did not comply with the then rigidly fixed standards of form and marking. Gardeners were awakened once again to new interest in Tulips and found for themselves new standards of beauty and perfection which in the flood of enthusiasm thrust academic standards aside and left them to the quiet backwater of content in which they may still be found. The very names of those wonderful old "florists' flowers are unknown to modern dealers and growers. Very few indeed among the present generation could even suggest where such varieties as Trip to Stockport, Annie McGregor, Dr. Hardy, Surpasse le Grande, Sir Joseph Paxton, Sam Barlow, etc., are to be found. They have become the emblems of an ancient cult—the treasured possessions of a small fraternity who annually worship at their shrine, and are in no way anxious to expose their beauties to the vulgar gaze.

Substantial progress has been made during recent years in the improvement of May-flowering varieties. Afterglow is a beautiful, rosy-apricot sport from Baronne de la Tonnaye, but it is altogether eclipsed by Dido, a flower of exactly the same colour. Zwanenburg and Carrara represent the highwater-mark of excellence in whites, while Vesta, the white May-flowering variety—not the broken bizarre of the same name—will undoubtedly be a leader in the class when better known. Noticeable features of these new Tulips are their length of stem and size of flower. The beautiful new

lily-flowered, yellow Alaska often reaches thirty inches high, while Louis XIV and Burgomeister Sandberg are other giants. There are numbers of new bronze, orange and yellow varieties, such as Orange Beauty (syn. Prince of Orange) and Canary Queen, which will unquestionably increase in popularity, as they exactly comply with modern taste, but all these flower in May. The need is for varieties of similar merit to flower a month earlier to fill the hiatus immediately following the Daffodil season.

The hybridising of Tulips upon the lines suggested would be both interesting and profitable. The actual process is simple. No better advice can be given than to study the chapter on the subject contained in the late Rev. Joseph Jacob's book on *Tulips*. Care should also be taken of early-flowering "sports" showing merit, as many valuable varieties are to be secured by this means. From that well-known old variety, La Reine, have been produced flowers of such diversity as White Hawk, Herman Schlegel, and Flamingo, all of which have originated as sports, and similar instances may be multiplied *ad infinitum*. Herbert G. Longford, Abingdon.

## SARGENT'S CHERRY.

In his *Cherries of Japan*, Wilson states that this species is commonly planted in Central Japan, but adds that he did not see undoubtedly wild trees south of Uzen, a province now called Yamagata. The first statement is contrary to my own experience. As a matter of fact, in the low-lying districts of the central and southern provinces, this Cherry does not appear to thrive, and the only example I saw in these localities was a crippled specimen in the Botanical Gardens of Tokyo. There are none in the famous Cherry Avenue at Koganei. In the mountains it certainly reaches as far south as the Yamanashi department in the Kai province, for I met with isolated specimens scattered through the deciduous forests between Lake Shoji and Lake Motosu, at three thousand feet or more, and I encountered it again in the Nikko district under precisely similar conditions. The former locality is at least 160 miles south of Yamagata province.

At the time of my visit the trees were conspicuously beautiful, and the thickly-massed bloom formed clouds of pink that could be seen for miles against the brown background of the still leafless forests. These alone, I consider, were almost sufficient to repay me for my thirty-thousand-mile journey. From my young plants in England I had often tried to visualise the splendour of a mature tree in full flower, but my wildest imagination fell far short of reality. In the soft spring sunlight they were inconceivably lovely. Standing fully fifty or sixty feet in height,\* all their boughs were wreathed in rosy-pink, through which peeped the burnished copper of the unfolding leaves. Growing in a wild landscape of mountain, lake and torrent, with Mount Fuji, or the Nikko range, towering snow-capped in the distant background (Fig. 19), these trees had an almost ideal setting. In the bright weather of a Japanese autumn, this Cherry must again be an object of great beauty, for even in England—where the climate does not favour autumn tints—the foliage assumes strikingly vivid colours. With me, quite early in the season, the leaves change to reddish orange and fiery crimson. As seen in its native country, no praise can be too extravagant for this tree.

From other Japanese wild Cherries, *Prunus sachalinensis* may be distinguished easily by the relatively large size of its pink flowers and the complete absence of any visible peduncle. The leaves are broader and rounder than those of the Hill Cherry (*P. mutabilis*), which is the species commonly met with throughout the central and southern provinces. Other characteristics of Sargent's Cherry are the viscid bud

scales and the dark chocolate-brown colour of the two- and three-year-old bark.

Owing to the fact that Cherry wood has been in demand for hundreds of years for making blocks for colour printing, fully mature trees are very seldom met with in Japan. On the Chuzenji road, however, there is an ancient specimen (Fig. 18), that has escaped the woodman's axe—possibly on account of the unusually large size of its flowers, which measure over one-and-three-quarter inch in diameter. This tree is no longer in its prime and its dead and "staggered" boughs are eloquent proof that its years are now numbered. The trunk, when I measured it last spring, was eleven feet in circumference, one yard above ground-level,

## MESENBRYANTHEMUM.

(Continued from page 12.)

### 1. CONOPHYTUM, N. E. BR.

THE following species are mostly additional to those already published in *The Gardeners' Chronicle*, 1922, vol. LXXI, p. 198, and 1925, vol. LXXVIII, p. 450, and indicate that this genus is a very large one. A century ago about ten species were known; at the present time (including those described below) over ninety species have been described, most of which I have in cultivation, and considering the vast

FIG. 19.—SARGENT'S CHERRY IN THE MOUNTAIN FOREST, NEAR LAKE SHOJI, JAPAN; MT. FUJIYAMA IN THE BACKGROUND.

Sargent's Cherry was introduced into America in 1890, but it did not reach this country until several years later. It does not seem to prosper in the light, gravelly soil of Kew, and probably prefers a cooler climate with a richer and moister rooting-medium. It should be quite hardy in all parts of England. I possess specimens, both worked on *Prunus Avium* and growing on their own roots; up to the present the latter do not appear to be making quite such good progress as the grafted plants.

I have seen a photograph of a large, pink-flowered, wild Cherry taken in Corea, which I suspect may belong to this species. As I have recently obtained seeds from that country, I hope, in due course, to be able to satisfy myself on this point. Judging by the photograph, it appears to be quite as fine, if not finer, than *Prunus sachalinensis*. Collingwood Ingram.

area in South Africa in the region where these plants thrive that is as yet unexplored, there are doubtless very many more awaiting discovery, besides several new ones I possess that will be described later.

As I have previously stated, it is almost impossible to make descriptions of these very remarkable plants from which they can be identified, as they have no parts or organs by which they can be contrasted for that purpose. And it is very unfortunate that very little is known of their range of variation, as this has never been investigated in their native country. But from material that has been sent to me from the same general region inhabited by a given species, received sometimes from the same contributor at different times, sometimes from different contributors, I find that some species undoubtedly vary considerably in appearance, so much so, that without knowledge of their origin, most would con-

\*I saw one tree, drawn up by the forest growth, at least eighty feet high.

sider them, in certain cases, to be distinct species. I find this to be particularly the case with *Conophytum placitum*, *C. polulum*, and *C. truncatellum*, and species of *Lithops* also vary very much. Therefore, plants from the same general locality that show some affinity to one another, and at the same time seem quite distinct in markings or appearance should be suspected to be variations of one species until flowers or other characters definitely prove them to be distinct. When raised from seeds taken from the same plant, I have found some species to vary greatly, and in the case of *C. polulum* and *C. placitum* repeating the marked variations of plants received direct from South Africa.

One of the best characters by which nearly allied but really different species can be discriminated is the minute structure of the epidermis as seen under a moderately strong pocket lens. The character of the epidermis when it differs, must, I think, indicate a real specific difference in the appearance of the plant, but, unfortunately, it is a distinction that is not always a describable one.

Figures of the types of form alluded to in the descriptions will be found in *The Gardeners' Chronicle* for 1925, vol. LXXVIII, p. 450.

All the species are arranged alphabetically and those described as new below are quite distinct from all others; in surface-contour the angular form of *C. novellum*, and the very distinctly prominent separate dots of *C. prae-parvum* cause these two species to stand out as being remarkably different from any others at present known. The peculiar loosely-forked stems of adult plants and neat-looking growths of *C. Marlothii* also mark this as one of the most striking in the genus.

Apart from the genera *Lemna* and *Wolffia*, the individual growths of the smaller species of this genus *Conophytum* are, I think, the smallest among flowering plants, and the flower is sometimes 3-4-times the diameter of the growth in size, as, for example, in the exceedingly beautiful *C. minusculum*.

**C. andausanum, N. E. Br.**—Growth as received, 5-6 lines high, 5-6½ lines broad, and 4½-5 lines thick, slightly compressed-obcordate, with a notch about 1 line deep at the top, and the lobe on each side of it rounded on side view and obtusely keeled; smooth, glabrous, dull green, sparsely sprinkled with small dark green dots, and with the notch outlined with a dark green or purplish line, from each side of which there extends a similar green or purplish line along the keel of the lobes. Flowers unknown.

Little Namaqualand: At Andaus Poort near Anenous, in the Richtersveld, Marloth 6908!

This species is nearly allied to *C. diversum*, described below, but differs very distinctly by the very conspicuous continuous line that outlines the notch and extends along the keels of the lobes.

The alliance of both these species appears to be with *C. gracilistylum*, N. E. Br.

**C. clarum, N. E. Br.**—Growth as received small, about 4 lines high, 2-2½ lines broad, and 1½-2 lines thick, obconic, elliptic in outline and broadly rounded at the top (type D. or E.), with a very slight central notch; orifice ½-¾ line long, very slightly depressed below the general level of the top, which is convex (not ridged) as viewed transversely to the orifice; surface smooth, glabrous, of a bright clear green, not at all shining, thinly sprinkled on the top with 20-30 small, dark green separate dots, and with a dark green blotch at each end of the orifice, usually formed of 3-5 dots connected together, and the blotches occasionally connected by very slender, dark green lines, so as to outline the orifice, which otherwise is not very distinct. Flowers not seen. Capsule 2 lines in diameter, 5-angled, with 5 valves and cells, slatey-grey. Seeds minute, scarcely ¼-line long, smooth, brown.

Calvinia Division: growing on or among granite rocks on the foothills of the Langeberg range, Pole Evans 6022!

Described from a living plant kindly sent to me by Dr. Pole Evans. This is a bright looking little species, quite distinct from any other I have seen.

**C. Comptonii, N. E. Br.** (Fig. 20).—Growth very small, as received 2 lines high and 1-2½ lines in diameter, but will probably become larger under cultivation; obconic, convexly-subtruncate at the top, which is circular or elliptic in outline and has a faint keel across it transverse to the orifice, which is ½-¾ line long, and distinctly depressed at each end; surface glabrous and slightly irregular from the markings being faintly elevated, greyish green with a faint brownish tint, with a horse-shoe-shaped mark of very dark green at each end of the orifice and a series of small dark green dots and markings around the margin of the top. Flowers not seen.

Malmesbury Division: Near Nieuwoudtville, Compton!

FIG. 20.—*CONOPHYTUM COMPTONII*.

A. Cluster of growths, natural size as received; B. a single growth enlarged five diameters.

For this minute but very distinct species I am indebted to Professor R. H. Compton, the Director of Kirstenbosch Botanic Gardens, after whom I have named it. Although a large genus, the species are grouped into few types, many kinds having a similarity in general appearance, but this very interesting species agrees with none of them, being quite distinct from all that are known to me, and therefore, although very small, by its great distinctness all the more suitable to bear the name of its energetic discoverer.

**C. diversum, N. E. Br.**—Growth as developed the first year after importation about 6 lines high, 4-5½ lines broad and 3½-5 lines thick, slightly compressed, cuneately obcordate, 2-lobed at the top, with the notch 1-2 lines deep and the lobes more or less closed together at their lower half, at least in the young state of the growth; lobes rounded at the top in side view, somewhat as in type P, somewhat compressed laterally into an obtusely-rounded keel; surface smooth, glabrous, light green, with a small and slightly darker patch at the base of the notch, and thinly sprinkled all over with very small, darker green, separate dots, but without a dark line along the keel of the lobes or around the lips of the orifice. Flowers not seen.

Little Namaqualand: near Anenous, in the Richtersveld, Marloth 6906!

**C. ectypum, N. E. Br.**, in *The Gardeners' Chronicle*, 1925, vol. LXXVIII, p. 468. At the place quoted, the description of the flower was made from a dried flower sent to me by Dr. Marloth, and the colour appeared to be magenta, as there described. My plant of Marloth 6365B, having now flowered, I find that the petals are not magenta, but of a delicate rose-pink, and there are four series of stamens and the style is 5½-6 lines long, instead of being as described. Whether this species varies to this extent, or whether some mistake was made in the flower sent to me, I do not know: flowers developed in future may determine.

**C. Brownii**, Tischer in *Moller's Deutsche Gärtner-Zeitung*, July 21, 1926, p. 257 is, in my opinion, a mere form of *C. ectypum* that is more truncate at the top and has a few more lines upon it; there is no other difference. Both plants were collected at the same locality

and were both sent by Dr. Marloth. I find that several species vary much in shape and markings, so that without other evidence I do not regard them of specific importance when the various forms come from the same place.

**C. flavum, N. E. Br.**—Growth 4-7 lines high and 3-6 lines in diameter, obconic, circular or elliptic in outline viewed from above, convex on the top, with a slight notch at the orifice on the larger growths only (type E.); orifice 1-2 lines long, slightly depressed, not gaping; surface smooth, glabrous, greyish-green, purplish on the sides, with the orifice outlined by a thick, dark green line and with some (not very numerous) separate dark green dots scattered over the top. Calyx 5-lobed; tube (but not the ovary) exserted, about 3 lines long, pale greenish; lobes 1-1½ line long, oblong, obtuse or subacute, green or perhaps reddish in full sunshine, pellucid-dotted. Corolla 6-7 lines in diameter, expanding in the morning in bright sunshine, closing at the latter part of the afternoon, not scented; tube finally about 1½ line longer than the entire calyx, pale yellowish; petals about 35 in about 2 series, 3-3½ lines long, ½-¾ line broad, linear, obtuse and slightly notched at the apex, bright golden yellow, shining. Staminodes none. Stamens about as many as the petals, in 2-3 series, all collected together at the mouth of the corolla tube and more or less exserted from it; filaments yellow at the upper part; anthers of the same yellow as the petals. Style 4 lines long, nearly as long as the stamens, slender, with 4 minute stigmas ¼-line long at the top, yellowish at the upper part, greenish below. Capsule when closed about 2 lines in diameter, obconic, flat on the top, with 5 valves and cells. Seeds about ¼-line long, smooth, pale brown.

Little Namaqualand, on shale rocks, near Steinkopf, Marloth 6904! Meyer (Marloth 6319)!

Described from a living plant kindly sent to me by Dr. R. Marloth. It is the first species I have seen of the small obconic type that has bright yellow flowers opening in the morning in sunshine.

**C. hians, N. E. Br.**—Growths they are first after importation 2-4½ lines high, 2-4 lines broad, 1½-3 lines thick, slightly compressed, obovoid or obconic, very shortly 2-lobed from a very gaping notch ½-1 line deep, and ½-1½ line wide at the top (type somewhat as at B.); lobes slightly keeled on the top, rounded into the back in side view; surface smooth, minutely puberulous and somewhat velvety to the touch, light green, without dots, but the keel of the lobes becoming reddish and the notch distinctly outlined with a darker green or perhaps reddish line when exposed to full sunlight. Flowers not seen.

Little Namaqualand: Locally frequent at Lekkersing, in the Richtersveld, Marloth 6915! 6928! 6929!

Described from living plants received from Dr. Marloth. Its small size, puberulous surface, gaping orifice and absence of markings clearly distinguish this from all other species.

**C. kubusanum, N. E. Br.**—Growth 2-3 lines high and 2-3½ lines in diameter, shortly obconic, circular in outline viewed from above, and nearly flat on the top or very slightly depressed at the centre (type nearly like F.); invested in friable, greyish sheaths; orifice ½-line long; surface smooth, glabrous, of a rather dark dull grey-green, marked with numerous separate scattered dots of darker green on the top and the orifice outlined by a dark line. Flowers not seen.

Little Namaqualand: At Kubus, in the Richtersveld, Marloth 6920!

Described from a living plant kindly sent to me by Dr. Marloth, who has included under the number 6920 what appear to me to be two distinct species. One of them is the type of *C. kubusanum*, and is described above, this has the growths densely crowded. The other form has the growths rather loosely clustered, they are 4-5 lines long and smaller in diameter than the plant above described,

## SPECIALITIES of MERIT for 1927

### DAHLIA COLTNESS HYBRIDS

About 18 in. high, single flowers of bright and varied colours; fine for bedding.

### SALVIA HARBINGER

Best Salvia extant; brilliant scarlet; dwarf, floriferous, and blooms from June till frosts.

### GEUM ORANGE QUEEN

Beautiful orange-scarlet; intermediate shade between Mrs. Bradshaw and Lady Stratheden.

### OENOTHERA TRICHOCALYX

Biennial Evening Primrose; large-flowering, pure white flowers remaining open all day.

### STOCK AVALANCHE

Superb biennial variety with pure glistening white flowers, grand for bedding or cutting.

### SCABIOSA COLUMBARIA (ANTHEMIFOLIA)

Fine perennial for garden and cutting; flowers 2-2½ in. across, 2 cols.; delicate mauve and rosy mauve.

## NOVELTIES OF THE YEAR

### FOUR ANTIRRHINUMS of the Nanum Grandiflorum class

Majestic Orange King, new giant-flowered type, grand spikes of brilliant deep orange.

Majestic Sunset, new giant-flowered type, splendid spikes of rich salmon-red

Dazzler, grand bedding sort, produces a mass of dazzling scarlet bloom

Red Emperor, flowers of rich deep scarlet shade, excellent bedding sort

Tom Thumb, Dainty Gem, delicate shade of rose, uniform habit

IRIS Chrysofor, flowers in June (within six months from seed), bright and varied colours, fine for cutting

VIOLA cornuta, Blue Gem (Jersey Gem), beautiful deep violet-blue, long blooming, resists drought well.

RANUNCULUS Asiaticus, Palestine strain, large double flowers, brilliant range of colour, very floriferous.

*Seed of the above can be obtained from all leading retail Seedsmen in the United Kingdom.*

**TURF, FIBROUS MOULD and LOAM**

Prepared cultivated turf for best lawns, bowling greens, tennis courts, etc.  
Also OLEAN MEADOW TURF FOR PLAYING FIELDS.  
Large or small quantities supplied. Enquiries and inspection invited.

**FROGLEY'S — HODDESDON — HERTS.**

**DOBBIE'S  
CATALOGUE AND GUIDE  
TO GARDENING**

144 Pages — 229 Illustrations.

**WOOD CHAIN-LATH BLINDS FOR GREENHOUSES**  
PATENT No 226110.

The Ring is endless and cannot possibly pull out being cut from solid metal, and is therefore not only  
unbreakable, but gives lateral rigidity and makes our Blinds unique.

SUMMER: WILL KEEP OFF THE SUN. WINTER: WILL CONSERVE HEAT TO A SURPRISING DEGREE  
Full Particulars from **TRANSENNA WORKS, LAYCOCK ST., LONDON, N.I.**

are elliptic instead of circular in outline and convex on the top, but the markings are very similar to those of the plant described, but fewer. Until both flower I cannot determine if these are distinct, as I suspect, or only varieties of one another.

**C. limbatum, N. E. Br.**—Growths 5-7 lines high, 2½-4 lines broad and 2½-4 lines thick, somewhat obovoid, slightly notched at the top with a slight and very obtuse ridge transverse to the notch, circular in outline viewed from above (type L., on a small scale); orifice about 1 line long, with gaping, triangular lips; surface smooth, glabrous, green, with a broad dark green line around the orifice and usually a dark green (or under continuous sunshine probably purplish) line along the top of the lobes, with or without another line or dot or two on each side of it, which are not raised above the general level. Flowers not seen; stated by Dr. Marloth to be purple.

Little Namaqualand; near Steinkopf. Meyer (Marloth 6508)!

This is evidently closely related to *C. ectypum*, N. E. Br., but as cultivated by myself under the same conditions it appears to be distinct. It is rather larger and of a lighter green colour, the orifice is less defined, the dark markings are not raised as they are in *C. ectypum*, and when examined under a strong lens the microscopic structure of their surface is quite different: in *C. ectypum* the dark markings under a lens appear very smooth and shining or polished, and the stomata (seen as minute whitish dots) are in a network of faint depressions and appear as paler patches between the dark polished lines on the top, but in *C. limbatum* the dark markings are not so shining and are seen to be minutely and densely pitted, and the stomata do not form pale patches between them; the corolla is light rose-pink in *C. ectypum*, but is stated to be purple in *C. limbatum* by Dr. Marloth, and when better known may prove to show a difference in structure. N. E. Brown.

(To be continued).

## NITROGEN FIXATION AND OUR FOOD SUPPLIES.

THE great industrial expansion and increase of population during the last century in this country soon reached a point where food requirements were greater than home supplies. From that time to the present we have imported large and increasing quantities of essential food stuffs. Such supplies have been drawn from the great open fertile spaces of the world. The wonderful virgin plains of Canada and the United States, to mention one region only, yielded splendid harvests year after year without the addition of artificial fertilisers. Agriculture in such districts was living on the accumulated resources of centuries. The situation in this country, however, has been quite different for many years. It is true that a plot of ground will go on yielding a Wheat crop of a sort without addition of manure of any kind. There is such a one at the Rothamstead Experimental Station, but the yield per acre soon falls below an economic limit.

Nitrogen in a chemically combined form is one of the essentials of plant life. Nitrogen constitutes about four-fifths of the air we breathe, but in the air it is in its native elemental condition, and as such, is practically useless for agriculture. There are in the soil certain bacteria which are capable of assimilating and combining nitrogen direct, but the quantity which they can thus 'fix' falls greatly short of that required under modern agricultural conditions. Nitrogen is an inert material and does not combine readily under easily obtainable conditions.

It is usually added to the soil in the form of a combination with oxygen or with hydrogen. Up to fairly recent years the principal sources of supply of fixed nitrogen have been the great

Chile nitrate fields, the product of which, sodium nitrate, may be classified as an oxygen compound of nitrogen, whilst the other, the familiar sulphate of ammonia, which may be regarded as a hydrogen compound of nitrogen, has been derived as a bye-product from the distillation of coal.

Now, since water is composed of hydrogen and oxygen, and the air of nitrogen and oxygen, it will be seen that the raw materials for the fixation of nitrogen are, at least in part, common to the whole of mankind. It has already been mentioned that for many years we have been living on the stored up agricultural resources of the world. Whilst these are far from being exhausted, their call for outside assistance in the form of fixed nitrogen is definitely increasing; to-day it is considerable; in the near future it will be enormous. It is, for example, open to grave doubt if the Chile nitrate fields and the gas works industry could between them supply the present nitrogen requirements of the world.

The rise of the synthetic nitrogen industry is one of the greatest chemical achievements of modern times, and is one of the utmost importance for the future of our food supplies. As this article makes no pretence to be exhaustive it is possible to give a broad summary of the industry.

It has already been mentioned that nitrogen is required combined either with hydrogen or oxygen; in either case the resultant material requires another substance to, as it were, solidify it and hold it down. The product of the combination of nitrogen and oxygen is an acid, nitric acid, which must be neutralised by an alkali, usually lime, before it can be used in agriculture, whilst the combination of nitrogen with hydrogen is an alkaline gas (ammonia) which must be neutralised with an acid, usually sulphuric acid. From the point of view of Great Britain it is impracticable to combine nitrogen with oxygen. In countries where the abundance of waterfalls furnishes very cheap electric power, it is possible to burn the air itself by means of an electric flame, forming nitric acid. This process is impracticable in Great Britain, and we have therefore to fall back on the combination of nitrogen and hydrogen, or, as the ancients would have put it, air and water. Here again, by reason of our lack of water power, an attractive possibility is ruled out. It is well known that by passing an electric current through water the latter is decomposed into hydrogen and oxygen gases, which appear separately at the places where the electricity enters and leaves the water. This process is dependent on cheaper power than we can produce in this country. So far as we are concerned the problem is solved by our great national asset of coal.

A process has recently been developed on a great scale in the north of England, at Billingham, County Durham, at the works of the Synthetic Ammonia and Nitrates Limited, a constituent of Imperial Chemical Industries Limited, which is already tending to, and will eventually, render us independent of foreign supplies. The raw materials are water, air and coke. It may be described in a simple manner by saying that coke is burnt, burning being combination with oxygen, in a mixture of air and steam, in such a way that the coke robs both the air and the steam of their oxygen and leaves a mixture of nitrogen, hydrogen, and the combustion product of coke, namely carbon dioxide. The carbon dioxide is removed with little difficulty, leaving a mixture of nitrogen and hydrogen which are the constituents of ammonia. These are then brought to a very high pressure and passed over a catalyst. A catalyst is a material which promotes, but takes no part in a chemical reaction, and can be used over and over again. They combine and form ammonia gas, which has to be reduced to a form which will render it useable and transportable. This is done by means of the above mentioned carbon dioxide, which, combining with ammonia to form ammonium carbonate, acts by double decomposition, on calcium sulphate, a material which this country possesses in very great quantities. Ammonium carbonate and calcium

sulphate yield ammonium sulphate—the chemical name for sulphate of ammonia, and calcium carbonate. The sulphate of ammonia produced as outlined above, is a first-class agricultural and horticultural manure. It can only be profitably made in enormous units with very high output, and it may be predicted that the future nitrogen supplies of the world will be produced at quite a limited number of places, one, and not the least important of which, will be in this country.

There is a very interesting connection between the fixation of nitrogen and the supply of explosives in war time. This country in the Great War derived the whole of its fixed nitrogen supplies from Chile. Germany did not go to war until she was assured that her nitrogen fixation industry was sufficiently developed to supply her requirements, as she could not hope to keep open the long sea route to Chile. It is now common knowledge that both the Allied and enemy General Staffs under-estimated their requirements in the early stages of the war and that Germany was compelled to and did expand her synthetic production enormously.

Explosives for war purposes may be roughly classified into propellants such as cordite, and explosives proper, such as T.N.T. and ammonium nitrate. All these materials which modern warfare consumes literally in thousands of tons, require nitric acid for their manufacture. It has just been stated that the great newly-established British nitrogen fixation industry produces ammonia. Ammonia when burnt with a limited supply of air yields nitric acid. It will thus be seen that both for peace and war the new development is of the greatest national importance. F. A. Freeth, F.R.S.

## HARDINESS IN PLANTS.

"Is it hardy?" is a question familiar to all who sell herbaceous and alpine plants, and it will undoubtedly become still more persistent as a result of the early and somewhat severe visitation of frost in the autumn of 1926. For several years we have had mild winters, and many plants have so successfully survived two, three, or more years, that we have grown perhaps a trifle too ready with an affirmative reply. Revision of some of the verdicts of recent years will obviously be necessary, even though the remainder of the winter provides no record-breaking frosts, but it behoves us to be wary of hasty and sweeping condemnation of good plants because we find some gaps in the borders and on the rock garden this coming spring.

Hardiness is, after all, relative or problematic in regard to quite a considerable proportion of our garden plants, and any decision to rigorously exempt anything and everything which cannot be depended upon to thrive and survive under varying conditions would rob British gardens of a very large number of plants which have become absolutely indispensable to our twentieth century standard of horticulture.

Much depends upon environment, and one can but acknowledge the wisdom of accepting the inevitable when it becomes plainly evident that a particular garden is incapable of keeping alive, perhaps, *Crimums*, *Gerberas*, *Eucomis*, or *Mutisia decurrens*, but one is disposed to place a low estimate upon the sincerity of the vaunted enthusiasm of a plantsman who banishes with disgust a plant for which he has professed affection simply because it has succumbed to unfavourable conditions. Alas! The hasty juror is usually vindictive to the extent that he will at every opportunity urge others to have nothing to do with the plant that he has placed under the ban of his disapproval.

Winter mortality is in a very large proportion of instances due, as much or even more, to cultural defects, whilst the whole blame is attributed to incapability of withstanding

frost. Feeding with stimulants too late in the season, premature removal of stems and foliage, mulching with moisture-holding and air-excluding litter, neglect of lifting, dividing and replanting at reasonable periods, transplanting fleshy-rooted subjects in late autumn, defective drainage, permitting a smothering overgrowth of aggressive neighbours, and removing the overgrowth when "autumn cleaning" is in progress—all or any of these are possible causes of winter mortality among plants which would otherwise behave magnificently, even in severe winters.

Methods of protection may be, and frequently are, responsible for as much damage in one direction as their warmth can prevent in another, and it is beyond dispute that the crowns and root-stocks of many plants rot under coverings of ashes, manure and dense litter, all of which are still too commonly used to protect plants from frost. In a nursery far removed from the ameliorating influence of the sea, and fully exposed to the rigours of winter, large areas of *Crinum*s, *Amaryllis*s, *Incarvilleas*, *Acanthus*s, and even *Arum* Lilies, have for a number of years been annually protected by spreading on the ground rough Briars, trimmings of Thorn hedges, Gorse and Heather branches, thatching this rough material with straw, held down by old netting pegged around the edges to secure it in position. Thus, an effective top cover is combined with reasonable access of air to the surface soil. Prior to the adoption of this method a thick covering of straw litter was placed immediately on the ground, but saturation soon made the surface soil slimy, and practically the whole stock rotted before spring.

*Pentstemons*, *Romneya Coulteri*, *Mutisia decurrens*, *Gazania*s, and *Phygellus capensis*, are among plants that I have kept winter after winter by simply sticking branches of Yew, Spruce, Box, *Ruscus* or Laurel in the soil between and around the dwarfier plants, and tying loose sprays of the lighter of these and of Bracken among the branches of the taller subjects. *Hydrangea hortensis* has come safely through several winters with this simple precaution. It is only fair to mention that this has been in a garden where the soil is porous, stony, and resting on a subsoil of chalk, and there is little doubt that on such soils growth is of a harder texture, and becomes better ripened than on softer, or heavier, retentive soils. The latter, admittedly, produces more luxuriant growth and larger flowers, but what is lost in size on the harsher soil is first counterbalanced by particularly fine colour in the flowers, and subsequently by a tougher constitution.

Wherever a fat, rich soil is coupled with exposure to hard winter weather, it is prudent to be sparing with stimulating fertilisers in late summer and autumn, and it is as essential to have thought for the improvement of drainage and porosity of the soil as to attend to overhead protection. On various occasions I have left *Dahlias*, *Salvia patens*, *Gladioli* and *Watsonias* in the ground all the winter, and they have more than once been hard bound by frost before any covering had been placed on them. Each time this has happened I have, whilst the ground was still frozen hard, covered the beds with a thick layer of dry ashes. Thawing has thus been rendered a very slow process, and when, by thrusting a rod through the covering, I have found the ground soft, the ashes have been taken off, and loose brushwood used. No mortality has followed, but on one occasion where a few *Dahlias* were overlooked in a border facing south, the tubers were found to be in a soft, pulpy state almost immediately after a rapid thaw.

I expect there will be many deaths among *Kniphofias*, *Gunneras*, *Dendromecon rigidum*, *Helianthus sparsifolius*, *Liatris*, *Meconopsis*, *Primulas*, *Rehmannia angulata*, and in some gardens even among *Coreopsis*, *Scabiosa caucasica*, *Funkias* and other usually hardy plants, but the losses will quite probably be of old plants which have lost vigour and health, and there will be no substantial reason for concluding that the kinds they represent must henceforth be left out of our planting schemes. M. R.

## RECENT WORK IN FRANCE ON THE PARASITIC CONTROL OF INSECTS.\*

### INTRODUCTORY.

WITHIN the past twenty years biological methods of control of injurious insects have been attempted in different parts of the world and have been applied almost exclusively to destructive species introduced to a country where previously they did not exist. Unfortunately, such introductions of animals or plants may prove extremely serious and cause irreparable

the Hawaiian Islands (*vide* Imms, 1926), and now, more recently, New Zealand, have been the pioneer countries in this method of dealing with injurious insects. This is almost to be expected. Our island situation and the comparative diminutive size of the home country make our entomological problems and consequently their method of attack, totally different from those in larger, newer and continental countries.

During a visit to entomological laboratories in France in 1925, the writer had an opportunity of observing the different kinds of work involved in biological control methods. Some account of these forms the subject of this article.

FIG. 21.—THE INSECTARIUM AT MENTONE.

damage, the introduced organism developing and increasing in a manner unknown in its native habitat. It has been shown that the cause of such an increase is due, not only, possibly, to more favourable climatic conditions, but chiefly to the absence, in the country into which an insect has found its way, of its natural enemies, parasites and predators, which in its native habitat keep it in check and maintain a harmless equilibrium.

### STUDY AND COLLECTION OF PARASITES AND PREDATORS OF AN INJURIOUS INSECT IN ITS HOME COUNTRY.

In the Eastern States of America, Maize or Indian Corn is severely attacked by a lepidopterous pest of European origin, *Pyrausta nubilalis*, the European Corn-borer. The caterpillar tunnels in the stems of the Corn causing extensive damage. Owing to its rapid spread

FIG. 22.—GROUP OF ITALIAN COLLECTORS OF PARASITES OF THE EUROPEAN CORN BORER, AT BERGAMO.

The form of biological control to which, up to the present date, most attention has been given, consists in the introduction of parasitic and predaceous enemies in an attempt, not to exterminate the injurious insect, but to restore the balance prevailing in its home country. A second type of biological control, of which almost nothing is yet known, is the possible utilisation of the parasites of indigenous insect pests.

In Great Britain we have had little, if any, opportunity of understanding by actual observation and experience, the work involved in the practice of biological control. America.

\*Notes from a paper contributed to the Zoology Section of the British Association, Oxford, 1926, by Ronald C. Fisher, B.Sc., Ph. D.

throughout the States of New England, New York, Ohio, Michigan, and especially Ontario, the situation is viewed with some alarm. *P. nubilalis* occurs in central and southern Europe along with its parasites, which, however, are absent in the United States. The effect of the indigenous parasites in that country is almost negligible. The United States Bureau of Entomology are at present attempting to introduce from Europe the parasites of this insect. The work has been in progress since 1919, during which time seven species of parasites have been introduced and liberated in infested states. Dr. Imms, reporting on a visit to America in 1925, states that it is yet too soon to tell what results and what success have been forthcoming. It appears, however, that of the

seven species, three have, so far, been recovered from the field in sufficient numbers to indicate some hope of their successful colonisation.

The headquarters of the European activities are situated at Hyères, in Southern France, where the U.S. Bureau of Entomology have established a parasite laboratory, under the direction of Dr. W. R. Thompson, with his assistant, Dr. H. Parker. A thorough and detailed study of the European fauna has been, and is being, conducted at Hyères in order to obtain an accurate and complete understanding of the rôle played by the parasites in Europe. Before there can be any hope of forecasting with what success certain parasites may be transferred from one country to another, it is necessary that an exhaustive study be made over a period of years in the home country of the injurious insect. This is being done at Hyères. A study of the parasitic complex of the European Corn-borer has been made in certain selected districts, each typical of different climatic and other conditions. Thus, studies and collections have been made at Auch, near Toulouse; in the neighbourhood of Paris; in Belgium; in the Po Valley of Northern Italy; in Southern Italy; at Naples and district—all of which localities are within convenient reach of Hyères. Material is collected by field workers in each district and is sent to the laboratory at Hyères, together with full data. Drs. Thompson and Parker periodically visit the different localities and thus keep in close touch with their problem in the field.

As a result of the method of tackling this problem, not only have supplies of parasites been obtained for shipment to America, but also it has been possible to correlate differences in the parasitic fauna of the host, in different localities, with variations in climatic and ecological conditions. Dissections of larvae form a large part of the laboratory work necessary in studies of this kind; it is essential to be able to recognise instantly all the stages, if possible, of the larvae of all the parasites of the host, on dissection of larvae, pupae or eggs. This is no easy task, but it has been accomplished at Hyères for the parasites of the European Corn-borer, and it thus enables the workers to estimate the percentage of parasitism in each district, of all the species of parasites concerned and of the individual species.

The method of organisation of collection on a large scale of parasites for shipment to America is of great interest. The writer had the privilege of seeing this carried out at Bergamo, in Northern Italy, by Dr. Parker, in August, 1925. The collection was undertaken when *P. nubilalis* in this district was about to enter the pupal stage. The parasites collected were all gathered as cocoons or in parasitised pupae of the Corn-borer. The actual collection of pupae and cocoons was carried out by squads of Italian farm labourers (Fig. 22). Four different gangs were working in different regions around Bergamo, the districts having been selected by Dr. Parker after a thorough inspection of the conditions in this neighbourhood. Each evening, the day's collections were brought to the temporary laboratory situated in Dr. Parker's hotel, there to be sorted into the different species, placed in an ice chest and left until a sufficient quantity had been obtained to warrant a consignment being dispatched to America. The parasitised pupae were packed in small cardboard boxes, a number of which were placed in a specially made wooden box. Full data concerning the contents and locality from which they came were put in each set of boxes; the complete collection was conveyed to the boat in a portable cold-store bag, and at the port of departure was given in charge of the steward and placed in the vegetable chamber. Details of the consignment and the date of departure of the boat were then wired to its destination in America; thus the work in Europe was completed. Two consignments were sent from Bergamo after a period of collection of two to three weeks. Each year a similar collection is made in that district, while at other times material is dispatched from other localities.

The fate of the parasites, provided they survive the journey, and the success of the whole venture,

depends, at least to some extent, on the treatment they receive in the country to which they are sent, there to be bred, and, in time, liberated in districts infested by their host insect, in this case, *Pyrausta nubilalis*.

#### PARASITES OF THE PEAR LEAF-ROLLING MIDGE FOR NEW ZEALAND.

Another parasite problem which is at present being attempted from France, concerns the collection of parasites of the Pear leaf-rolling Midge, *Perrisia pyri*, a Cecidomyid fly, for introduction to New Zealand. It appears that there are two areas in New Zealand, in the neighbourhood of Auckland and Nelson, where this European insect has been causing grave concern, and from which it is spreading slowly but steadily. The New Zealand Government entomologist, Mr. D. Millar, is anxious to attempt biological control of this insect. By arrangement with Dr. G. A. K. Marshall, of the Imperial

towards the end of August and again in the end of October, when the writer was sent to France in order to obtain what he could at that late time of year. Some success was achieved in New Zealand from the consignments sent out in 1925. An account of the parasites obtained and the experiments attempted with them in New Zealand is given by Mr. Millar (1926) in a recent number of the *N.Z. Journal of Agriculture*. During the present year, 1926, arrangements were made for consignments of larvae of the Pear leaf midge to be sent from Versailles and other districts in France throughout the months July-October. A visit was made to France in July to organise this work; M. Bru, préparateur at the Station Entomologique, at Paris, undertook the collection. Each month a consignment of larvae was sent at a given date, in time to be placed on board a boat leaving London for Wellington, New Zealand. Pear leaves containing larvae of *Perrisia* were packed in damp, sterilised, Sphagnum-moss, and placed

Photo M. Bru.

FIG. 23.—A CONSIGNMENT OF PARASITISED LARVAE OF *PERRISIA PYRI*, COLLECTED IN FRANCE FOR SHIPMENT TO NEW ZEALAND, AUGUST, 1926.

Bureau of Entomology, this work has been going on from France during the past two summers. Unfortunately, it has not been possible for a detailed study of the European parasites of this midge to be undertaken. At present, all that has been carried out is the collection of larvae of the Pear midge in the hope that parasites will be reared from these in New Zealand, bred there, and, in time, liberated in the districts where the host is so injurious in that country.

During the summer of 1925, the writer, in company with Mr. J. G. Myers, of the New Zealand Department of Agriculture Entomological Laboratory, undertook some investigations of the parasites of *Perrisia pyri*, in France. Studies were conducted in the extensive orchards of the École d'Horticulture at Versailles, through the kindness of the director, M. Pinelle. Numbers of larvae of the Pear leaf-rolling midge were collected and examined for parasites in the laboratory of Dr. Paul Marchal, in Paris. Three species of parasites were found, and it was decided that in accordance with the wish of the authorities in New Zealand, consignments of larvae be sent out to that country. This was done

in small wooden boxes. These (Fig. 23) were posted to the High Commissioner for New Zealand, in London, and, on arrival, were at once conveyed to the vegetable chamber of the boat sailing immediately for New Zealand.

#### COLONISATION AND DISTRIBUTION OF INTRODUCED PARASITES.

The French Ministry of Agriculture has established at Mentone a parasite laboratory for the study and rearing of parasitic and predaceous insects. This laboratory is an annexe of the Station Entomologique at Paris, the centre of the French Agricultural Entomological service, of which Dr. Paul Marchal is the Director.

In 1912, the cottony-cushion scale, *Icerya purchasi*, once the dreaded pest of the Orange groves of California, made its appearance on the Riviera. The remarkable and almost miraculously successful introduction and colonisation in California of the Australian lady bird-beetle, *Novius cardinalis*, is one of the outstanding examples of successful biological control. It is well-known that by the introduction of this Coccinellid beetle and by its activity in feeding upon *Icerya*, the Orange plantations

of California were saved, and this scale insect no longer was regarded as a serious pest.

Conscious of the grave menace threatened by the presence of *Icerya* in France, Dr. Marchal (1913) immediately obtained supplies of *Novius* and attempted to establish it in the infested districts. Such was in reality the cause of the creation of an Insectarium at Mentone. It was not till 1917, however, owing to the war, that a laboratory was actually established (Fig. 21). At the present day one of the chief functions of this laboratory is to continue the distribution of colonies of *Novius*, sending them each summer, wherever the scale appears in numbers. Every now and then this insect appears in some hitherto uninfested area where colonisation has not been made. Supplies of this valuable beetle are reared in the Insectarium and are distributed to the required places, packed, as fully grown larvae or as pupae, in small-meshed wire cylinders. Each cylinder, sent through the post in a wooden box, contains also a small piece of *Mimosa* or other food plant on which are a few *Icerya*, to give support to the larvae during transit. On arrival at the infested area all that is done is to hang the cylinder on a tree situated well within the infestation, remove the cork at one of the ends, and colonisation proceeds of its own accord. Colonies of *Novius* are sent from Mentone to all parts of the Riviera, Italy, Spain, Algeria, Turkey and Switzerland.

Attempts have been made to introduce to southern France another Coccinellid beetle, *Cryptolaemus Montrouzieri*, to reduce the ravages caused by "mealy bugs" of the genera *Pulvinaria*, *Pseudococcus*, *Dactylopius*. Although *Cryptolaemus* has become established, at least, in certain localities, yet its successful acclimatisation cannot be compared to that of *Novius* (Poutiers, 1922).

All over France an extensive campaign is in progress to control the Apple Woolly Aphis, *Eriosoma lanigera*, by means of the Chalcid parasite—*Aphelinus mali*, introduced from America to many parts of the world. Dr. Marchal has established in his garden near Paris an insectary where *Aphelinus* is reared and from which it is distributed for colonisation throughout France. One understands that Mr. Fryer, Director of the Ministry of Agriculture's Pathological Laboratory at Harpenden, is at present investigating the possibility of establishing *Aphelinus mali* in this country for the biological control of the Woolly Aphis.

The results in France vary considerably in different districts. It seems probable that the climatic conditions of the district in which colonisation is attempted do not, in every case, favour the establishment and development of the parasite. In the south and in Italy, in the neighbourhood of Florence, one was given favourable reports on the success which has resulted from the introduction of *Aphelinus*. Further north, however, reports were much less convincing. At Chalette-Montargis, some little distance south of Paris, for example, while some success has been attained, yet in the opinion of M. Gaumont, of the entomological station in that town, a much more important and useful part has been played in that locality by the indigenous Coccinellid beetle, *Exochomus quadripustulatus*.

At Rouen, the director of the entomological laboratory, M. Regnier, stated that colonisation of *Aphelinus mali* had been attempted repeatedly in Normandy. At first very confident of success, M. Regnier (1924) has been compelled to modify his hopes. Almost invariably, *Aphelinus* has emerged in spring before the Woolly Aphis was sufficiently advanced to provide the food necessary for the parasite to continue its reproduction; consequently, many adults perished, and in order to maintain the parasites in the district, re-introduction was necessary. The value of *Aphelinus* in Normandy is still uncertain. This is of particular interest to us since the climatic conditions in this part of France approximate closely to those prevailing in southern and south-western England.

It was with great interest that one heard recently

from Dr. R. J. Tillyard, of his attempt at the Cawthron Institute, New Zealand, to cross adults of *Aphelinus*, sent by Dr. L. O. Howard from localities in America of entirely different climatic conditions. The object of this experiment was to obtain, if possible, a race of parasites which might adapt itself to the conditions in New Zealand. Dr. Tillyard has distinct hopes of success. The evidence from France, which shows markedly varying degrees of success in acclimatisation of *Aphelinus* in that country, indicates further that there, also, successful colonisation might be obtained more easily by careful selection of *Aphelinus* stock in its home country, and by the breeding of a particular race suitable to the conditions prevailing in the country or part of the country into which it is introduced.

#### A STUDY OF THE PARASITES OF INDIGENOUS INSECTS.

French workers have been undertaking for some time past, what is urgently needed in our own country: a study to determine the actual rôle played by parasites in the development, and history, from year to year, of insect pests which have long been with them and which, periodically, if not annually, cause severe loss to agriculture, horticulture and forestry. One could mention as examples of this type of work the studies of Picard (1922) at Montpelier, and of Faure (1926) at Lyons. Similar studies are in progress at present at Paris and at Rouen on other indigenous insect pests, e.g., the Hyponomeutid moths of fruit trees.

One cannot urge too strongly the value and importance of a detailed study of the ecology of the more important injurious insects in our own country. One of the first things to be done is the making of a general parasite survey throughout the country. The following few headings under which such work might be undertaken may be of interest as showing the extensive field of observations such work must necessarily cover.

- I. Distribution of the host insect (injurious species concerned). Its economic importance;
- II. Collection and examination of meteorological data in each district, over a period of years.
- III. Examination in each district of the entire biological complex of host and parasite, comparing differences in parasitic fauna in different districts, and attempting to correlate such with climatic or ecological variations.
- IV. Determination of the rôle played by the parasites, collectively and individually, in periodic fluctuations, if any, of the host or hosts.
- V. Life-history and description of all stages of all parasites concerned.

Such a programme entails an enormous amount of work, but there is no doubt as to the invaluable information it would yield. One would arrive at some real understanding of the conditions governing the development and distribution, in our own country, of such injurious insects as the Winter Moths—*Cheimatobia brumata*, and *Hybernia defoliaria*; or the different Tortrix moths, *T. buoliana* of the Pines, or *T. viridana* of the Oaks. It is not improbable that such information would indicate the lines along which preventive and control measures would most successfully be developed in the future.

The field for parasite investigation is vast, and in this country has scarcely yet been touched. One hopes that within the next few years entomological research in Britain will develop along those as yet unexplored paths. The insect problems of agriculture, horticulture, forestry and commerce, can be dealt with successfully, and untold losses prevented, when a thorough and complete knowledge has been obtained not only of the life-history of

the injurious species, but also of its relationship to its surroundings and to its associated insects, in short, its ecology.

#### RARE GARDEN WORMS.

THE worms which one normally encounters in the garden are all native species and are usually widely distributed. There are, however, certain other species to be met with from time to time which are at first somewhat perplexing. Indeed, in the case of several forms, the problems are deep and fascinating. We may divide these worms into two groups. There are, firstly, those which are clearly not indigenous, and must therefore have been introduced in some way or other; and then, secondly, there are a number which might easily be indigenous, because they belong to genera which are regularly represented in these islands, but yet are rare; and instead of being generally distributed in all kinds of gardens are only to be met with in a limited number. As the gardens in which these occur are often widely separated, and are usually of a special character, one is led to suppose that their denizens in such cases may frequently be importations which make no attempt at colonization or conquest.

It is with these latter that the present paper is concerned, and the questions on which we are seeking light are simple and yet important ones. Are these less common forms indigenous or imported? If indigenous, why are they so narrowly distributed, and why do they not wander into other fields? If imported, how is it that they usually seem quite at home, and continue to thrive from generation to generation, as in some instances, at least, we know they do by observations extending over a lengthy period? More perplexing is the problem why we find in our English gardens a number of worms which, while they seem to be foreign, have never yet been found in other parts of the world!

Let us take as our first illustration the worm known as *Sparganophilus*. The genus was first created by Benham, and was based on specimens found among the roots of the Bur Reed (*Sparganium*), at Goring-on-Thames, in 1892. Since that time quite a number of new species have been found in America and elsewhere, but so far as I am aware, this species (*S. tamesis*, Ben.) is unrecorded for any other habitat. When in 1910 I received from Mr. Bartlett, of Pencarrow, in Cornwall, a number of long, wiry worms found by him in a Lily tank, breeding freely, and evidently quite at home, it was impossible to find any record of its occurrence elsewhere. I therefore named it eventually *Sparganophilus elongatus*, and the types which are now in the British Museum remain unique. How are these facts to be explained? Is *Sparganophilus* originally a native, say, of America, introduced like a certain water weed into this country? If so, why has not the species been found elsewhere? But if it is a native how can we account for the two species remaining undiscovered outside

these two localities? Though they might easily be indigenous, it is a curious fact that the only other representative of the family found in this country (*Anagaster fontinalis*, Friend) is a water worm found by me in 1907, in a well at Mildenhall, Suffolk.

It is the common genus *Allolobophora*, however, which presents us with the greatest variety of problems. This genus is now divided into a number of sub-genera, and in dealing with the different forms I shall employ the sub-generic title without reference to *Allolobophora*, in order to avoid confusion. There is one form, however (*Eisenia veneta*, Rosa), which is so polymorphic, and has so many varieties in the British Isles, that I must reserve it for special treatment later. Let us examine one or two typical cases of rare garden worms concerning which it is at present impossible to say whether they are or are not indigenous. There is, for example, the interesting case of the worm which for the present I regard as *Dendrobaena submontana*, Vejd. If it is an importation it nevertheless breeds freely both at Cambridge and at Kew, but outside these two localities is at present known nowhere else in the British Isles.

More widely distributed is the Mottled Worm (*Helodrilus ictericus*, Sav.) which I recorded in 1905 as occurring in the old Physic Garden at Chelsea. Later I found it in the Botanical Gardens at Cambridge. It has not been found, to my knowledge, elsewhere in Great Britain, and seems, therefore, to be an importation, since it is known to occur in Italy, France and Switzerland. Another curious illustration of our subject is unique, inasmuch as the specimen (*Octolasion intermedium*, Friend) found by me in 1909 at Oxford, does not seem to be known anywhere else in the world. It might be a foreigner, but if so, where is its home? It might equally well be a native, seeing that the genus is represented by two or three well-known and widely distributed species. But if a native, why is it never found elsewhere under similar conditions? I have examined tens of thousand of specimens of earthworms during upwards of five-and-thirty years in every part of the country, as well as abroad, but have never met with this species in any other locality.

Then there is *Allolobophora similis*, Friend, which was so named on account of its resemblance to the well-known Green Worm (*A. chlorotica*), which is found in every part of the country by ditches and pools, and wherever cattle puddle. The two related forms are clearly distinct. They differ in the position of the girdle and in the segments which carry the so-called tubercula pubertatis. The male pores, moreover, which are on prominent papillae in the native Green Worm are scarcely distinguishable in the allied and strangely rare form, which I found in Kew Gardens, May 3, 1910.

In 1913, while collecting at Blenheim, I found some specimens of a worm which I have never seen elsewhere, and referred them to Michaelson's *Helodrilus antipae*. I also found in Dublin the same year a specimen which seems to agree perfectly with the Norwegian worm (*A. norvegica*) of Eisen. Then there is, the case of the Luminous Worm (*Microris levis*) and the large earthworm found in Ireland, but never collected in England, though it occurs in the Pyrenees and other places in Europe. Beddard thus refers to the matter in his *Zoogeography*, published in 1895. Since that time, however, many new facts have been brought to light.—"The Rev. H. Friend reports (*Ir. Nat.*, Feb., 1894) the presence of a species of *Lumbricus* (*L. papillosus*) in Ireland, which has not yet been found elsewhere, and Mr. Benham's peculiar new genus, *Sparganophilus* found in the Thames is, so far as we know, limited to that river. There are one or two other examples of *Oligochaeta* which have not been met with outside the British Isles."

If the smaller worms were included, the list could be considerably extended. It is greatly to be regretted that the garden worms to be found in such places as Chatsworth, Madresfield, Trentham, Holkham, Compton Wynyates or Windsor have never yet been investigated,

and I should be glad to have the privilege of reporting on careful collections from such old-time gardens. Specimens placed alive in tin boxes lightly filled with moss travel well by post, and should be sent to "Cathay," Solihull, Warwickshire. *Hilderic Friend*.

## FRUIT REGISTER.

### APPLE HOARY MORNING.

WHILST there are many culinary Apples of much better quality than Hoary Morning (see Fig. 24), no variety is more beautiful in appearance, for broken stripes of bright crimson cover the skin, sometimes, as in the specimen illustrated, over the whole surface. It is a very old Apple and may be found in many

FIG. 24.—APPLE HOARY MORNING.

orchards in the west of England. The tree makes moderate growth and may usually be relied upon to fruit freely. The fruits are in season from October to December. Although the origin is not known, Bunyard, in *A Handbook of Fruits*, states that it probably originated in Somersetshire. It is known also as Dainty Apple, Downy, Sam Rawlings and New Margil. The illustration in Fig. 24 represents a fruit of natural size, and shows the very characteristic crimson markings and regular contour of the fruit; it was brought to the meeting of the Royal Horticultural Society on October 12, 1926, and those who saw it considered it to be one of the most perfect samples of its kind.

Hoary Morning is one of the old fruits for which many have a great affection, apart from any considerations of quality, and it would be a pity if these old favourites were allowed to die out. Like Cathead, Tom Putt and Joaneting, which Kentish folk always call Jenneting, these Apples of former days have a sentimental value to older folk, which the younger will also appreciate as the years pass by.

## BIENNIAL CROPPING OF APPLES.

In *The Gardeners' Chronicle*, of December 18, 1926, p. 496, Mr. Grigor Roy definitely disagrees with the theory that the Apple has a natural tendency to crop biennially, and he supports his argument by admitting that "if biennial cropping once becomes a habit it is very difficult to check even with drastic thinning." He has also observed that Apple blossom is often infertile on trees which have produced a bumper crop the previous year.

Both these statements seem to suggest that the biennial cropping habit is entirely natural, and that Mr. Grigor Roy's argument supports the very theory to which he so strongly objects. He seeks—by the artificial device of thinning—to correct this biennial cropping habit, and claims that young trees, if thinned every year, bear good crops annually.

*Market Grower* (*Gard. Chron.*, May 29, 1926, p. 381) states, under the heading "Biennial Fruiting of Apples," that "it has been proved that thinning the fruit is no remedy."

Many growers seem to think that thinning the crop will reduce the weight of the yield and thereby lessen the strain on the tree. Judicious thinning does not reduce the weight of the crop; it only reduces the numbers of fruits, and as a result we have the maximum weight of crop the tree is able to produce, but of large, well-formed Apples, instead of, possibly, the same weight of crop, made up of small specimens.

It would appear, therefore, that, since the tree will produce its maximum weight of fruit, whether thinned or not, the same amount of energy is expended in crop production and that thinning does not conserve this energy for the following year's crop.

*Market Grower* suggests in his article, quoted above, that some method of manuring and pruning might be adopted as a means of correcting this biennial-bearing habit, and adds that this is, "however, a matter for research stations."

This leads us up to the question, Does the Apple acquire a natural tendency to crop biennially? as suggested by Mr. J. Wilson in the issue of December 4, 1926, p. 455. The theory is, I believe, recognised by research workers and growers alike. Mr. N. H. Grubb, writing on the "Objects and Methods of Pruning" (*E. M. Report*, 1925), gives as one of a number of objects: "to check and possibly help to control biennial bearing by equalising the strain of the tree."

The leading article on page 1, *Gard. Chron.*, June 3, 1926, dealing with the experimental work on the manuring of fruit trees at Long Ashton Research Station contains this sentence: "Valuable results are no doubt to be obtained from orchard trials on known varieties so designed as to discover the manurial treatment which leads to the highest and most consistent yields, keeping 'annual' croppers at a high and steady yield and converting 'biennial' croppers, into annual bearers."

It must be assumed then, that biennial cropping is definitely recognised by both Long Ashton and East Malling Research Stations, therefore one would naturally hesitate to suggest that the biennial cropping theory is a fallacy but before accepting this theory as fact, it may be desirable to examine the evidence in favour of another cause.

Examples of this kind could be continued but these are sufficient to indicate what experienced practical growers think as to the causes of the Apple crop failure in 1926, and one cannot fail to be impressed by the reasons advanced.

Reference may be made to the Warwickshire County Council *Ann. Rep.*, 1925, on "Fruit Plots." On page 9 appears an instructive table of Apple cropping from 1906 to 1924, inclusive.

I append a selection of six well-known varieties from this table, showing the relative crops obtained during the past ten years, 1915 to 1924, inclusive.

I have chosen the six varieties from many others included in the official report, irrespective of their cropping behaviour, and a close study of this table may provide sufficient proof for those whose minds are prepared to accept the theory of biennial cropping that here they have ample evidence to strengthen their belief.

On the other hand, those who are inclined to favour the idea that the cause of failure lies in other directions may also find evidence to support their belief.

The lack of definite evidence and the uncertainty of the Apple crop would lead one to suggest that the word "irregular" be substituted for the word "biennial." *William J. Moyse, Assist., Hort. Dept., County of Southampton.*

"What effect a superabundance of blossom has upon the fruit crops it is hard to say, although many experienced growers contend that only when flowers are vigorous do they set fruits, and that when trees are crowded with blossom the individual flowers lack vitality. Yet this cannot be the sole cause for the deficiency, for such kinds of fruits as blossomed before the late frosts occurred are cropping fairly satisfactorily, whereas the later-flowering ones have no crops worth mentioning. Unfortunately the Apple crop, which is the most important of all, is the most unsatisfactory, and the reason is not far to seek, and may be summed up in the two words—the weather." This quotation from *Gard. Chron.*, August 7, 1926, p. 101, suggests that the real cause of the failure of the Apple crop is directly due to unfavourable climatic conditions during the critical stage of blossoming, and this has the support of many successful gardeners, as a study of the reports on the hardy fruit crops, published in this journal, will show.

The following passages will serve to illustrate this:—

Mr. D. Buchanan, for Scotland, W.: "Fruit trees and bushes gave every prospect of a good crop until the middle of May when we had 5° and 7° of frost, and which caused great disappointment, especially in regard to the Apple and Pear."

Mr. J. A. Woods, writing from Durham, states: "All fruit trees gave promise of heavy crops, as they were smothered with blossom, particularly Apples, but the cold winds and several sharp frosts in May dashed all our hopes to the ground."

Mr. J. Winder, reporting from Northumberland, wrote: "Owing to the cold, sunless spring and keen frost, the fruit crops are a dismal failure."

## VEGETABLE GARDEN.

### VARIETIES OF VEGETABLES.

In the selection of varieties of vegetables, the same caution is required as in the choice of any other subject for cultivation in the garden. The trade catalogues always include a number of novelties, yet old favourites, long tried and seldom found wanting, should be depended on chiefly. To choose novelties is, perhaps, a less perplexing task than to determine which of the old-established ones to grow, for of these last there are, in a great many of the classes, far too many, and a reduction of the lists is desirable. Do we need one hundred sorts of Peas, or fifty sorts of Onions, or a similar number of Lettuces or Cabbages, or thirty sorts of kidney Beans or Broad Beans? On the surface, it would appear quite easy to eliminate inferior kinds, but it is obvious that they are retained in cultivation because the public, much more than the seedsmen, favours them, for it doubtless appears to the latter a matter of business prudence to comply with current demands, and hence they continue to grow stocks of sorts they know to be comparatively worthless because a certain number of their clients will be sure to purchase them. It cannot be doubted, however, that the seedsmen might contribute in an eminent degree to the elimination from their catalogues of inferior varieties, for every trade can exercise an influence on its supporters, and probably none more so than the seed merchants. Why should there be any delicacy in saying plainly that "such and such a variety can be supplied, but not coming up to present-day needs, cannot be recommended"? Such a proceeding would crush the demand for inferior sorts, to the advantage of all parties. The cultivator would ensure a higher order of production, and the trade in seeds would be considerably simplified. In the choice of novelties the purchaser

necessarily engages in a speculation. The reputation of the house that introduces the novelty is usually a sufficient indication of its relative merit and, as a matter of fact, a seedsman must have some fame as an introducer of new varieties to ensure an immediate sale for them. But it is fair to ask where we should be if the public had persistently refused to encourage raisers and vendors of new vegetables? We should certainly have obtained very few of the many superb varieties we now possess, for commercial encouragements have played their part in aiding the production and distribution of improved varieties quite as much as horticultural enthusiasm. The disappointments are, all things considered, relatively few compared with the successes. The newest varieties are, of necessity, the dearest, but amongst the established sorts there are plenty of good things, and it will be found, as a rule, that the best of these have been introduced in comparatively recent times. There is no excuse whatever for the retention of an inferior variety in any class of any garden list.

It is a common mistake of inexperienced people to consider size as the most important of all qualities, alike in flowers, fruits and vegetables. Within certain limits, size is undoubtedly of importance, but the moment we favour size at the expense of flavour or succulence in vegetables we encourage retrogression, and voluntarily surrender some of the greatest advantages that have been secured by painstaking cross-breeding and discriminate selection. One can admire gigantic Rhubarb and Celery, colossal Cabbages and Beetroot, but they may be remarkable only for their coarseness, and every grower knows well that the largest Onions are the worst keepers. Good flavour, tenderness and beauty of appearance, are three most important qualities, and should be sought in preference to size, although, as already remarked, when certain limitations are recognised, every advance in the size of any particular vegetable is an advantage, in that it increases its productive capacity. In the light of modern research also the resistance of a variety to disease is an all important factor, and this is a quality in which novelties may not have been sufficiently tested. It is not an easy matter to ascertain from a catalogue the relative popularity of the various sorts of garden seeds: a peep into the seedsmen's books might tell us this, but it would be no sure guide to selection, for many inferior varieties are constantly in demand. If the public taste on this point is in need of education, will the seedsmen undertake to enlighten them as suggested above, and thus bring nearer the day when worthless garden varieties shall become truly obsolete? *W. Auton.*

## HOME CORRESPONDENCE.

### Cordylone australis fruiting in Scotland.—

An interesting sequel falls to be recorded to the flowering of *C. australis* so freely this season (see *Gard. Chron.*, vol. LXXX, pp. 27 and 29), and while perhaps not unusual further south, is certainly noteworthy in Scotland. The great panicles of flowers have, in many cases, set seeds freely, and the small berries containing these seeds are clustered so thickly as to give the impression that the plants are once more in flower, when viewed from a distance. Some branches or panicles of these small fruits are white, while others have a distinct pale blue shade, and it is interesting to note that in nearly all cases the white ones have been attacked, if not devoured by birds, while the blue ones have been left by the birds, so far, alone. Several garden-truck loads of these have now been removed, and only a few of the best left to demonstrate their usefulness from a decorative point of view during the winter. It will be interesting to watch during the next season or two whether any of these seeds will germinate in any quantity, as, so far, only one tiny seedling was found during 1926, and it is doubtful whether it was a home-grown one, or the result of mice or birds carrying off seeds sown under glass. *A. T. Harrison, Culzean Castle Gardens, Ayrshire.*

## SOCIETIES.

### ROYAL SCOTTISH ARBORICULTURAL.

#### ABERDEEN BRANCH.

The annual meeting of this branch was held on Saturday, December 18. There was a representative attendance, and Mr. John Michie, M.V.O., Kincairn, near Aberdeen, the President, occupied the chair.

The most interesting feature of the proceedings was an address by Dr. A. W. Borthwick, D.Sc., F.R.S.E., the first occupant of the new chair of Forestry at Aberdeen University, who took for his subject, "Tree Frontiers."

Mr. G. D. Massie, advocate, Aberdeen, Secretary and Treasurer, read the annual report—the twenty-first of the branch—which stated that the membership was now 167. The office-bearers were appointed as follows: Mr. John Michie was re-elected President; the retiring Vice-Presidents re-elected were Lord Forbes, Castle Forbes; Mr. S. T. Gammell of Countesswells; Major R. J. Nichol of Ballogie, and Mr. Donald Munro, O.B.E., Banchory. The following retiring members of the Committee were also re-elected: Lord Glentanar, Aboyne; Mr. John Rule, Huntly; Mr. Alex. Robson, Aberdeen; and Mr. Edwin Duthie, Aberdeen. Mr. Massie was re-elected Secretary and Treasurer.

The President intimated that a special committee recommended that the attainment of the majority of the Branch, which would take place on May 18, should be marked by a meeting, to be held that day, to which representatives of kindred societies would be invited, and at which Mr. C. S. France would give a paper reminiscent of the work of their branch since its inception. The company would dine together. The suggestions were cordially approved.

Professor Borthwick was then called upon to deliver his address on the subject of "Tree Frontiers." He opened by saying that the absence of many of the American-Asiatic Conifers in Europe was due more to physical and accidental causes than to natural limitation of the frontier, and when they introduced certain species, they might be merely reinstating the descendants of originally indigenous species. However, that did not mean that an exotic species might be cultivated anywhere and everywhere in Great Britain, although this country was within the range of its climatic limits. In Britain they had a wealth of introduced Conifers and other trees. They might take it for granted that the primary object was the introduction of exotic trees for ornamental and arboricultural purposes. Hence they found the majority of those newer Conifers confined to parks, policies, gardens and pleasure grounds. In course of time, encouraged by the fine growth which certain of these trees showed and reports of their enormous yields of timber in their native countries, foresters were induced to try them in plantations as timber trees.

Some of these experiments were successful, some were failures. In spite of the undoubted success which had attended the cultivation of the newer exotic trees under forest conditions here, they must not be carried away by enthusiasm and forget their older and well-tried friends—the native Scots Pine, the Norway Spruce and the Larch, the latter two of which had been grown sufficiently long in Britain as to be now regarded as almost indigenous.

The reasons which induced foresters to look for new trees were easily summed up. An exotic was worthy of cultivation in their forests if it was of a species at present unrepresented, and was capable of producing timber of utility, or if it possessed advantages in rate of growth, and was not exacting as regards soil and climate; if it yielded useful timber and was more resistant to indigenous enemies, such as fungi, insects and animals, than those at present in cultivation; if it possessed better qualities as a shelter and nurse tree than those at present grown—that was, if it offered silvicultural advantages to other species by association with them.

Size alone was no criterion, because size, to a large extent, depended upon age. No doubt, given suitable soil, site and protection, they might, with time, reproduce the giants of the Californian and British Columbian forests in this country, but there was an economic limit to the length of rotation they could afford in their cultivated forests. Therefore, the qualities he had mentioned should be their guide in selecting new trees.

Coming to the questions of how they could ascertain if new species possessed these qualities, Dr. Borthwick said there were two methods open to them. The first was the one adopted in the past; that was trial and error, but this was a long, haphazard and costly method. The other method was quicker, less costly and more reliable—that was, a study of the tree within its natural frontiers, in order to gain information as to the kind of environment and growth factors to which it was suited, because "the plants of any region are the exponents of its climate." If they found trees of economic utility in regions where the growth factors were similar to their own, they had good reason to suppose they would thrive with them.

The next step was to plant these trees along with, or under, similar conditions to those which were native, in order that a fair and exact comparison might be made. But no matter which method they adopted, final and conclusive evidence could not be forthcoming until these trees had completed a full rotation. Then, and not till then, were they in possession of all the facts necessary for a complete knowledge of the species under trial. While they had gained new and commercially valuable species by trial and error, they had meantime hopelessly lost others through carelessness with regard to diseases—he referred to the Silver Fir and White Pine. And they came dangerously near losing the Larch, through at first planting it anywhere and everywhere outside its natural frontiers. In all cases where trees were artificially cultivated outside their natural habitats, they could not be too vigilant. A trifling change in one single growth factor might determine success or failure.

Until they had carefully studied and examined every detail of environment in regard to the ecological requirements of each species of tree, they had not got at the bottom of its distribution. Who knew but that certain species, which trial and error had condemned as useless, might not yet prove to be of value if given the right environment and treatment? And it was not beyond the bounds of possibility that they might obtain even better results than they got at present with the more promising species, such as Douglas Fir and Sitka Spruce. The more complete their knowledge of their life processes and the reaction to environment became, so would their methods of selection and treatment improve.

A point of the highest importance in dealing with exotic trees was the province or locality from which seeds or seedlings were obtained. He pointed out that different forms or types existed within the species, and that, the more widely extended the geographical range of a species, the more it was liable to exhibit constitutional differences which were expressed in variation in response to environment. They must not forget that most trees were dual organisms. They possessed mycorrhiza, and if the seeds alone were introduced, the appropriate comensal partner might be left behind. An analogous phenomenon may be seen when new nursery ground was being broken in for seedling tree production. Such ground did not attain its full yield capacity until the appropriate mycorrhizal organisms had become established.

The President opened an interesting discussion which followed Dr. Borthwick's address.

### GARDENING APPOINTMENT.

Mr. F. Jackson, late gardener to T. ROWBOTHAM, Esq., Gilbertstone, South Yardley, Birmingham, and previously gardener to Maj.-Gen. Sir OLIVER NUGENT FARREN, Connell Mount, Nugent, Co. Cavan, Ireland, as gardener to G. HANFORD, Esq., Dainsu, Brancaster, Kings Lynn, Norfolk. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

## Obituary.

**Thomas Coomber.**—It is our sad duty to record the death of a very old friend and one of the oldest contributors to *The Gardeners' Chronicle*. Mr. T. Coomber passed away on December 23 last, and was laid to rest in the churchyard of Llangattock, near the scene of his great life work. For upwards of forty-seven years he was gardener at The Hendre, Monmouth, serving under the first and second Lords Llangattock and the Hon. Lady Shelley Rolls. As a young man, Mr. Coomber set out to become an efficient, practical gardener, and his special inclinations were toward the cultivation of fruits and a writer on gardening subjects. He was born at East Grinstead, but commenced his gardening career so far north as Crimonmogate, Aberdeenshire, where he was apprenticed, and remained for four-and-a-half years. Subsequently, he became journeyman at Knole Park, Sevenoaks, and also at Woburn Abbey, and afterwards was foreman at Pencarrow, Cornwall, and at Rendlesham Hall, in Suffolk. He left Rendlesham Hall to enter service with Messrs. James Veitch and Sons, at Chelsea, and, later, was recommended by that firm to take charge of the Hendre Gardens, where he became famous as a cultivator and was particularly successful at exhibitions of the Royal Horticultural Society, the Royal Botanic Society, and at Alexandra Palace, where he won numerous substantial prizes and gold and silver medals for fruits. His first exhibit was of Black Hamburg Grapes, at one of the exhibitions at South Kensington, where he obtained second prize. For many years Mr. Coomber was regarded as the premier cultivator of Pineapples under glass, and it is of interest to observe that his splendid exhibit of twenty-six Queen Pineapples, shown at Holland House in 1913, for which he received a Gold Medal, were grown in a pit that contained only thirty plants. For many years Mr. Coomber was a member of the R.H.S. Fruit and Vegetable Committee, and in 1910 he was awarded the Victoria Medal of Honour in Horticulture, which was a fitting reward for his long and able services in the cause of horticulture. Mr. Coomber retired in 1921, and his portrait and an appreciation appeared in our issue of May 14 of that year. Mr. Coomber was a frequent and able contributor to the horticultural press, and his first engagement as a writer was to contribute the weekly articles on "Fruits under Glass," for *The Gardeners' Chronicle* of 1884. By his kindly manner and his desire to do all that lay in his power to forward the interest of promising young gardeners who came under his charge, Mr. Coomber endeared himself to a very wide circle of friends, all of whom will learn with great regret of the passing of this fine old gardener.

**Edwin Hillier.**—We regret to record the death of Mr. Edwin Hillier, Senr., of Kingston House, Winchester, one of the veterans of the trade, who passed peacefully away on December 24, 1926, in his eighty-ninth year. It is interesting to note that he started his career in the celebrated Syon House Gardens, Brentford, where many of the old school of gardeners and nurserymen of his day were trained, and at Messrs. Osborne's Old Nursery, Fulham. About sixty-two years ago, after his marriage, he settled in Winchester, and purchased the business of the late Mr. Farthing, which he quickly extended. Since his retirement, fifteen years ago, the business has been carried on by his two sons, Messrs. Edwin L. and Arthur R. Hillier, and has been developed into a large retail concern, covering almost all branches of horticulture. He leaves a widow, now in her ninety-third year, three sons and three daughters. The funeral took place at Winchester, on Tuesday, December 28, and was attended by representatives of all branches of the business, including Mr. Harry Rumbold, who has a record of fifty-five years' continuous faithful service, and other members of the staff, with from twenty-five to thirty-five years' association with the firm.

**George McLean.**—Widely known in horticultural circles in the Nottingham district, Mr. George McLean, late of Chilwell, died on December 28 last, at the residence of his son, Mr. A. McLean, of 39, Acton Road, Long Eaton. The late Mr. McLean was in his 78th year, and was a native of Glasgow. For many years he was gardener to the Earl of Lichfield at Shudborough Hall, and for over twelve years carried on business at the Wollaton Hall Gardens as market gardener. He excelled in fruit culture under glass, and had written numerous articles on the subject. He retired from active business over twelve years ago.

**Louis Plumeré.**—We regret to learn of the death, on November 29, of M. Louis Plumeré, the well-known horticulturist of Belfort, France, in his sixty-first year. The deceased, who was an officer of the Mérite Agricole, and held several official positions in horticultural organisations, exercised considerable influence in creating and extending the love of flowers in Belfort, and it was his great desire to see the inhabitants of the town, as in so many Alsatian and German towns and villages, decorate their balconies and windows with the beautiful blooms which are the admiration of so many foreign visitors where the custom is established. M. Plumeré had been ill for some time before his death, and suffered considerable pain. He leaves a widow and family to mourn his loss.

**Matilda Smith, A.L.S.**—Notwithstanding her splendid work on behalf of horticulture and botany, small recognition and few distinctions came to Miss Matilda Smith during her association of more than forty years with the Royal Gardens, Kew, and the various publications concerned therewith. All who have a working acquaintance with the *Botanical Magazine* will remember the familiar initials of "M. S.," which certified that the drawings were from her brush and pencil, but few will remember that her familiar signature first appeared so long ago as on Plate 6,386 of that great work, for which she executed something like 2,500 drawings. Under the advice and tuition of Sir Joseph Hooker, Miss Matilda Smith commenced her work as botanical artist about the year 1878, and succeeded the late Mr. W. H. Fitch in that work, but in addition to executing the drawings for the *Botanical Magazine*, she was the sole artist and lithographer for Hooker's *Icones Plantarum* from the year 1881 until her retirement; indeed, Mr. G. Bentham, under whose auspices this publication appeared, provided in his will not only for its continuation, but that Miss Smith should continue as artist so long as she chose so to act. For this work she executed over 3,000 drawings, the correctness of which has never been called into question. Other works to which she contributed drawings include the *Botany of the Challenger Expedition*; the *Flora of Socotra*; the *Botany of Afghanistan*; the *Flora Simlensis* and Cheeseman's *Illustrations of New Zealand Plants*. She also made a large series of drawings of new and interesting plants which flowered at Kew, and also made facsimile copies of plates that happened to be missing in any of the illustrated works in the Herbarium Library at Kew, so as to make the books practically complete. Miss Smith lived at Kew, took a keen interest in local affairs, and was Guardian of the Poor for the Kew Ward of the Borough of Richmond. In the social life of Kew she held an unique position and was loved and esteemed by all who knew her. In 1916 her fellow Kewites elected her as President of the Guild, and on the occasion of the annual meeting of that year held in the Physic Gardens, Chelsea, she sprung a surprise on those present by graciously entertaining them to tea. Miss M. Smith's particularly useful life came to an end only a few days ago, and it is a matter of deep regret that the Royal Horticultural Society's award of a Silver Veitch Memorial Medal was so long deferred.

REMARKS.—Prices remain very firm in this department and supplies generally have been limited during the past week. Chrysanthemums are gradually lessening in quantity, more especially the coloured varieties. Bronze, pink and yellow blooms have advanced most in price since Christmas Eve, such as Amber Bronze, Mme. Charvet and December Pink, and Winton and Negoya yellow. Of white blooms Cheshunt White and Favourite are the best of the dis-budded varieties. Of bunch Chrysanthemums Cheshunt White and Heston and Winter Cheer can only be recommended; a few bunches of Allmann's Yellow are obtainable at high prices. Daffodils and Tulips are increasing in quantity, and small consignments of Soleil d'Or are being received from Cornwall and the Channel Islands in good condition. The newest subjects in this department are Freesias and a few blooms of Iris tingitana. Cut Dutch-grown white Hyacinths in boxes are arriving in good condition. Roses, which realised 18/- to 24/- per dozen owing to the increased demand for the New Year festivities, have been reduced in price since Saturday. The quality of Richmond and Madame Butterfly is very fine. White and mauve Lilac is arriving from Holland in very fine condition, also Prunus triloba. Supplies from the south of France were below requirements last week, but better supplies are anticipated from now onwards. Anemones, Ranunculus, Marguerites and Acacia (Mimosa) have been checked by the severe weather conditions. White and yellow Narcissi and Violets were more plentiful this morning.

REMARKS.—Conditions ruling just now are certainly quiet, but not more so than is to be expected at this time of the year. The most active section is that handling the consignments of fruits from South Africa. The fruits of the latest shipment, consisting of Peaches, Plums, Apricots, and a few Strawberries, are in good condition and selling satisfactorily. Business in the Apple market is decidedly slow and will probably continue dull for a few days. Oranges are good and cheap—too cheap considering how good they are, and should be a better trade. English Apples are not plentiful, but only Bramley's Seedling and Cox's Orange Pippin are wanted; other sorts are feeling the competition with imported Apples. Hothouse Grapes are a good trade, and with Belgian produce on the short side, English Grapes are a firm trade. The sprinkling of Cucumbers coming to hand sell well, but are costly. Home-grown Tomatoes are now practically finished for the season. Tomatoes from the Canary Islands are a good trade. Salads are scarce and dear—Lettuce, Endive and Batavian Endive in particular, selling well. Belgian Chicory is, however, comparatively cheap. Forced vegetables, such as Asparagus, Beans and Potatoes, are not plentiful and have made even higher prices than are at present ruling. The quantities of Mushrooms are inclined to be heavier and values are a little less stable than they have been for some time. Potatoes are a firm market, good samples selling well.

### GLASGOW.

Following the activity of Christmas week, business in the cut flower market was much quieter during the few remaining days of 1926. The Chrysanthemum season is rapidly waning, but these flowers are being substituted by Tulips, which are not yet very plentiful. Prices continued good, especially in the case of Roses, which were worth from 14/- to 18/- per dozen. Carnations at 6/- to 8/- were easier, while Narcissi made 1/- to 2/- per dozen for small bunches, and 3/- to 5/- for large. Montessor Tulips sold at 1/- to 1/3 for 6's. Thomas Moore, 1/- to 1/4; Le Matelas, 1/2 to 1/6; and William Copland, 1/9 to 2/6. Disbudded Chrysanthemums averaged 2/6, and sprays of Heston White, Chesham White and Baldock's Crimson made 10d. to 1/6 per bunch. Winter Cheer, 10d. to 1/9, and Wilcox, 1/- to 1/6. Lilac realised from 1/6 to 2/-, Hyacinths in pans found a ready sale, but some of the plants which were dwarf and almost stemless only realised 1/- each, while the prices for better specimens varied from 2/- to 4/-.

The feature of the fruit market was the keen competition for Valencia Oranges, the imports of which have been stopped owing to the frosted condition of the fruits. Counts of 300 advanced to 25/-; 360's, 19/- to 22/-; and 714's and ordinary 420's, 36/-. Jaffa Oranges, which will constitute the main source of supply during the next few weeks, were also dearer at 18/- to 17/- per case; prices for Mandarin 420's ranged from 10/6 to 16/- per half-case, and trays from 1/5 to 2/-. Apples, Pears, Lemons and Grapes. Fruits were quoted unchanged. The value of Tenerife Tomatoes ranged from 12/- to 23/- per bundle. The market was closed on Saturday.

### ANSWERS TO CORRESPONDENTS.

**CLUB ROOT IN CABBAGES.**—E. H. W. To correct the tendency of your Cabbages to develop "Club Root," any form of lime is suitable, although quick-lime is the most rapid in action. Any form that may be obtained should, therefore, be used for the purpose. Thorough cultivation of the soil is essential to rid it of insect grubs, soot being a good deterrent. Many grubs that are found in the soil are innocuous, and some are even helpful.

**MAGGOTS IN SOIL.**—B. B. The maggots are fly larvae, living principally on the great amount of organic matter in the soil. They may have been breeding in the soil used for potting various plants. If the plants are potted, it will be difficult to kill the maggot without injuring their roots, therefore, wherever possible, use soil free from maggots. To clear infected soil, the most effective method is to use heat. Where this is impossible, one of the advertised soil fumigants should give good results. If a chemical soil disinfectant is used, some time must be allowed to elapse before the soil is used for potting purposes.

# SITUATIONS VACANT

## MUNICIPAL AND PUBLIC.

### COUNTY BOROUGH OF BURNLEY. PARKS DEPARTMENT.

THE Corporation of Burnley invite applications from experienced gardeners for the position of FOREMAN in charge of a public park. Candidates should be between 30 and 40 years of age, with good, practical experience, fully qualified in propagating hard- and soft-wooded plants, preparing cut flowers and arranging floral displays in bedding, herbaceous and otherwise.

The salary will be £228-35 per annum, being the maximum year of Grade C1 of the Corporation's Grading Scheme, which salary will be subject to variation in accordance with the cost of living. The successful candidate will be required to reside in the house provided, and to pay a rent of £14 10s. 0d. per annum therefor.

Applications must be submitted on forms to be obtained from the Borough Engineer and Surveyor, and delivered to him not later than Tuesday, the 18th January, 1927.

Canvassing, either directly or indirectly, will be a disqualification.

COLIN CAMPBELL, Town Clerk.

Town Hall,  
Burnley.  
January, 1927.

## Potato Varieties, II.\*

DR. SALAMAN'S book on the subject of Potato varieties, a first notice of which has already appeared in these columns (see p. 21), deals with thoroughness with the methods employed in raising new varieties. Of possible methods which might lead to the production of new varieties are tuber-selection, and self- and cross-fertilisation followed by tuber-selection. If, however, the definition of a variety which Dr. Salaman puts forward be adopted—as we think it should be—it follows that the selection of tubers of a given variety is likely to lead nowhere. For, according to that definition, all the tubers of a variety, arising as they do by vegetative propagation, are identical. Therefore, save for occasional mutations which might arise, selection from among the tubers can lead to nothing novel. Practical experience confirms the conclusion reached on theoretical grounds, for almost every variety of Potato which has been introduced

into commerce has been raised, not as a result of tuber-selection, but from seeds produced either by self-pollination of a given variety or by cross-pollination carried out between two distinct varieties. When a given variety is self-fertilised it either gives rise (in relatively rare cases) to uniform offspring identical with the parent, or it yields offspring which are by no means identical. In the former case selection is powerless to produce anything new, but in the latter it is, of course, the method which may be applied with every certainty of its leading to the isolation of new varieties, though whether any of the latter turn out to be of economic value cannot, of course, be predicted; for in breeding and selection it is profoundly true that "many are called but few are chosen." The importance of a knowledge of the genetics of the Potato (that is the behaviour in inheritance of the series of characters which constitute the varietal characteristics) is self-evident. If, for example, it is known how skin colour, tuber shape, haulm character, eye character of tuber, colour of flesh and so on arise, then the breeder, who on the basis of this knowledge chooses plants for breeding with the object of combining in one of their descendants desirable characters which occur, some in the one and some in the other parent, will have a brighter prospect of success than if he chose two varieties haphazard. Take but one example: as Dr. Salaman points out, earliness is a recessive character, that is, an early crossed with a true-bred "late" Potato will give offsprings which are not early. Maincrop Potatoes are sometimes pure for lateness, sometimes not. Therefore, if a breeder aims at producing a new early Potato, he must work either with existing earlies or cross an early with a late variety which experience has shown to be carrying the factors both for lateness and earliness. Again, genetical analysis has demonstrated that immunity from, and susceptibility to, wart disease are Mendelian characters, dependent, however, on more than one pair of Mendelian factors. Here again the way of the plant breeder is made easier. Nevertheless, it has to be admitted that even so, neither scientific nor other plant breeders have, as yet, been able to produce immune varieties which are in other respects equal to the best of the varieties which are susceptible. Yet in this quest, not yet brought to a successful issue, science has the last word, for it shows, or at all events supplies strong evidence for believing, that the production of immunes equal to the best susceptibles is not impossible. As to the varieties themselves, Dr. Salaman considers the various efforts which have been made to classify Potato varieties and finds them all bad; or, if not bad, at all events, of little value. He tackles this important question in another way, substituting for a strict classification a classified guide which he hopes will be useful in enabling any one to give a name to a Potato crop and to any rogue which may be growing therein. The scheme is based on flower and foliage character, and whilst admittedly imperfect, does, as it seems to us, fulfil its purpose. Those who would like to test it during the coming summer will find the Guide set out in full in Chapter VIII. Other subjects of importance with which Dr. Salaman deals are varietal differences in time of maturity of the crop, yield and the Mendelian factors which determine it, and the environmental influences which affect the crop. The last subject, which is treated with commendable fullness, comprises the consideration of many facts of the greatest interest to cultivators—

provenance of seed (with respect to which he reaches the conclusion that a place which gives rise to good seed is primarily one in which mosaic diseases are relatively rare, or at all events, do not spread so rapidly into the tubers as they do in districts in which experience shows that it is inadvisable to save one's own seed), size of seed tuber, maturity of tuber, the use of cut tubers as sets, and the preliminary sprouting of tubers. Other subjects dealt with in later chapters are virus diseases, and synonyms, in connection with which all interested in Potato varieties should scan the formidable list of synonyms on pp. 140-162. Finally, in Chapter XXIV is given a description of the varieties in more general use in this country. The work is beautifully printed—as becomes a book issued by the Cambridge University Press—and its illustrations, both in colour and in black and white, are admirable. Dr. Salaman's book is one of the first fruits of the new and more scientific method of studying horticulture. In this method the thoroughness and enthusiasm which older generations have brought so successfully to bear on the advancement of horticultural knowledge are maintained and rendered more effectual by the linkage with scientific knowledge. That knowledge grows slowly and often lags behind practice, but none will deny that it is the basis on which a sound system of horticultural practice must be established. By showing this incidentally, no less than by his masterly exposition of the theme he has chosen, Dr. Salaman has laid us all under a heavy debt of gratitude.

**Forthcoming Trials at Wisley.**—The Royal Horticultural Society will carry out trials of annual Poppies, Sweet Sultan, culinary Peas (late varieties only, half-pint of each required), Onions, Parsley, Sweet Corn and Beet during the coming season. One packet of each variety should be sent to reach the Director, R.H.S. Gardens, Wisley, Ripley, Surrey, on or before March 31, 1927. (Goods via Horley Station, Southern Railway).

**Richmond Hill.**—At the meeting of the Surrey County Council, which took place at Kingston-on-Thames, on the 11th of January, it was decided to make a contribution of £500 on condition of the Richmond Council contributing a like sum, towards the purchase of the Orleans riverside estate at Twickenham, which will practically safeguard the beautiful view now to be obtained from Richmond Hill. The land, which will cost £10,000, will be acquired by the Twickenham Borough Council, and will be thrown open to the public, forming a continuation of the existing riverside walk from Richmond towards Twickenham. The purchase price, within a few hundred pounds has already been either promised or collected

**Paris Spring Show.**—The Centenary Exhibition to be held in Paris at the end of May this year is to be held at Cours-la-Reine, on the banks of the Seine, where so many successful horticultural exhibitions have already taken place. The list of members of the English Committee is to hand, and we are glad to see among the names of those participating such well known British horticulturists as Lord Lambourne, Sir William Lawrence and Col. Durham, President, Treasurer and Secretary respectively of the Royal Horticultural Society; Miss Ellen Willmott; Sir David Prain, formerly Director of the Royal Botanic Gardens, Kew; Dr. A. W. Hill, the present Director; and Mr. C. H. Curtis, Managing Editor of *The Gardeners' Chronicle*. Irish horticulture is to be worthily represented by Sir Frederick Moore and Mr. J. W. Besant, past and present Directors of the Glasnevin Botanic Garden, and among the countries taking part, other than European, are Brazil, Canada, the United States, India,

\* *Potato Varieties*, by Redcliffe N. Salaman, M.D., Cambridge University Press. Price 25/- net.

the Union of South Africa, Australia and New Zealand. The list of prizes offered is a long one, and includes valuable presentations from the President of the French Republic, the Ministries of Public Instruction, Agriculture and Commerce, and a number of public authorities and societies.

**North and Central American Plants in the Sloane Herbarium.**—At the meeting of the Linnean Society, on the 6th inst., the President showed a series of lantern slides illustrating some of the early botanical collections from North and Central America contained in the Sloane Herbarium at the British Museum. These included a small collection of mosses and liverworts from Virginia, by the Rev. William Clerk (1729), and one of flowering plants from the same collector arranged in months according to the time of flowering; a collection of Joseph Lord from Carolina (1704) containing good specimens with neatly written descriptive labels; extensive collections from Carolina and Virginia in 1710 and 1711 by John Lawson, Surveyor-General of North Carolina from 1701 to 1711, who met his death in an expedition against the Indians in the latter year (many of the specimens bear Lawson's original labels with date, locality and other information, and references to his book, *A New Voyage to Carolina*) (1709); examples from James Petiver's *Hortus Siccus Americanus*, which was purchased by Sloane and forms part of his herbarium; (among these are specimens sent from the Scots Settlement in Darien by Archibald Stewart, surgeon, 1699); and collections from Maryland by the Rev. Hugh Jones, who died in 1701, a resident in Calvery County, Maryland, and by William Vernon and Dr. Kreig, who made a joint expedition to Maryland (1698) and brought home a large number of plants, which were catalogued by John Ray. Some of Ray's annotations are preserved with the specimens. They were later named by Dr. Solander, in whose manuscripts are descriptions of the novelties. Photographs were also shown illustrating a collection by William Bartram (1739-1823), and containing specimens of the plants mentioned in his *Travels through North and South Carolina, Georgia, &c.*, (1791).

**A Long-keeping Melon.**—Mr. A. J. Sanders, gardener to Col. Giles Loder, High Beeches, Handcross, Haywards Heath, has sent us such an interesting account of a long-keeping Melon that we publish his communication in full: "A very old friend of mine, Mr. A. Alderman, whose portrait appeared in these pages some time ago, sent me, in 1925, a few Melon seeds received from his son in South Africa. Some of the seeds were sown, with those of other sorts, in 1926, and the plants, when ready, were cultivated in the usual way in cold pits, wherein Violets are grown during winter. Early in September the few fruits remaining were cut and laid on a shelf at the back of a lean-to Muscat vinery; some ripened and were used, one or two shrivelled and were useless but two remained sound, both the produce of the South African seeds; one of these I sent to my old friend at the time, who wrote me a very charming letter in return. My one remaining Melon (South African variety) was examined from time to time; it kept its colour and remained sound; just before Christmas, 1926, I removed it from the shelf, and as it had an odour suggestive of ripening, I removed it to a house, where Lady Downes Grapes were still hanging, placing it directly over the hot-water pipes, which are kept just warm to suit the Grapes. On December 30, I again examined the Melon, and its pleasant odour suggested that I might risk sending it in to the house for dessert—especially as my employers had friends to dinner—and take the chance of a wiggling. The next day I was greatly surprised; the appearance of a Melon on the table had been the subject of interesting and favourable comment, and I was told that the fruit was quite equal in flavour to any eaten during the usual Melon season. I examined what little of the fruit remained and found it was perfectly sound flesh of a deep green colour and strongly aromatic. The seeds were quite plump and some of these I am saving, although I have some left in the original packet. The description on this packet reads: 'S.

Africa, 1925; green flesh, clear skin; one of the sweetest and finest-flavoured Melons I have ever tasted (Bert).' As a Melon cut in September and used on December 30 seems to be something out of the common, I have penned these few lines and should like to know if any of your many readers have had a similar experience of the keeping qualities of a Melon. Perhaps this particular variety only has that quality."

**Mr. Robert L. Harrow, V.M.H.**—For over thirty years, Mr. R. L. Harrow has demonstrated his skill as a cultivator at the Edinburgh Botanic Garden, but he has carried out his work so unostentatiously that certain folk who are not acquainted with that famous garden may have been surprised to learn that he has been awarded the Victoria Medal of Honour in Horticulture. His many friends, however, have wondered why the honour was so long delayed. Mr. Harrow had an excellent training for the position he occupies at Edinburgh, a position corresponding to that of Curator

MR. ROBERT L. HARROW, V.M.H.

at Kew and elsewhere. He is a native of Kent, and his training began in the gardens of Heronden Hall, Tenterden; while still in his teens he obtained employment with Messrs. B. S. Williams and Son, at Holloway, where he became acquainted with the large numbers of plants then grown under glass in a high-class nursery. His next post was that of journeyman at Neville Court, Tunbridge Wells, where he remained three years before going to Leyswood, Groombridge, where Orchids were made a special feature. Following three years at Leyswood, Mr. Harrow went to the Botanic Garden, Cambridge, where, under the late Mr. I. Lynch, his knowledge of plants was greatly increased, and he gained a good working knowledge of botany and of the methods of propagating and preparing plant material for the services of the University. In 1891 he entered Kew, with high recommendations from Mr. Lynch, and became sub-foreman of the Fernery Department. Two years or so later, Sir Isaac Bayley Balfour, Regius Keeper of the Edinburgh Botanic Garden, was, with the consent of the Treasury, preparing to rebuild the range of glasshouses there, and came to Kew in search of a young man to take charge of that department; Mr. Harrow was chosen on the recommendation of Sir William Thistlethorn Dyer. A few years later he was appointed Assistant Head Gardener at Edinburgh, and on the resignation of Mr. A. D. Richardson he was given that full charge he has so eminently justified. During his long stay at Edinburgh, Mr. Harrow has seen many changes in the Botanic Garden and has taken

his full share in the alterations and improvements made under glass and out-of-doors, while his associations with the late Sir Isaac Bayley Balfour and the present Keeper, Professor W. Wright Smith, have always been of the pleasantest.

**Annuity for a Gardener.**—In his will, the late Rev. W. D. Rudgard, rector of Longford, Warwickshire, who died last October, left an estate of over £25,000. The income is to be equally divided between his gardener, Mr. William Sephton, his secretary and his housekeeper, for life.

**Glasgow Flower Show.**—An application by the Directors of the Glasgow and West of Scotland Horticultural Society for the use of the new Kelvin Hall on the occasion of the annual exhibition in the first week of September has been refused by the Corporation, as the Committee were unable to pledge themselves that the new hall, now in course of erection, would be ready in time. A meeting of the Directors has been called to consider the position, which is similar to that of a year ago, when it was decided to hold the 1926 show in St. Andrew's Hall, but as a financial loss of over £300 was incurred on that occasion, it is probable that the list of classes will be further restricted, and the prize-money reduced so as to avoid a repetition of last year's shortage, which was not due to any decline in public patronage. Marquees provide an alternative, but there might be a difficulty in obtaining a suitable site, and the weather in September involves considerable risks.

**National Rose Society's Summer Show.**—The summer show of the National Rose Society will be held in the grounds of the Royal Hospital, Chelsea, on Friday and Saturday, July 1 and 2.

**Horticultural Club.**—The opening dinner and lecture of the Winter-Spring Session, 1927, of the Horticultural Club took place on Tuesday last at the Trocadero Restaurant, Piccadilly Circus, London, and was a great success. The company numbered forty-four; Mr. Gerald Loder, Chairman of Committee, presided, and amongst the guests were Lt.-Col. F. R. Durham, Secretary of the Royal Horticultural Society, and W. R. Oldham, Esq., a member of the Council of the Royal Horticultural Society. After the dinner, Mr. Wm. Cuthbertson, V.M.H., gave an address on "Some Horticultural and Other Notes Gleaned on a World Tour." Mr. Cuthbertson's remarks were very entertaining, and regret was expressed at the close that he had not been able, owing to limitations of time, to give an account of his journeys beyond India; many expressed the wish to hear an account of horticultural conditions in New Zealand and Canada, which Mr. Cuthbertson promised to give on a future occasion. The Chairman said the meeting was the most successful for a long time; in welcoming the guests he took the opportunity of congratulating Colonel Durham on his recent engagement to be married, and he hoped that on another occasion he would be present with his wife. Mr. Loder, in thanking Mr. Cuthbertson, whom he referred to as one of the best-known men in the horticultural world, expressed the great pleasure all had derived from his interesting address.

**Fifth International Botanical Congress, 1930.**—A meeting is to be held in the Linnean Society's Rooms at Burlington House, Piccadilly, on Thursday, January 27, at 3.30 p.m., to initiate arrangements for the fifth International Botanical Congress to be held in 1930.

**Sugar Beet in Yorkshire.**—The increase in Sugar Beet cultivation in mid-Yorkshire led to the erection of a factory at Poppleton, where work was commenced last October. The formal opening took place last Friday, when the ceremony was performed by Lady Invernairn, the wife of Lord Invernairn, of Strathnairn, one of the Directors of the Second Anglo-Scottish Beet Sugar Corpora-

tion, which owns the new factory. During the short time the Poppleton factory has been working, 50,000 tons of Beet, yielding 6,000 tons of sugar, has been sliced. The daily capacity of raw Beet dealt with is 1,000 tons, and 400 men are employed. At the opening ceremony Lord Weir, Chairman of Directors, stated that the company made a point of being, so far as possible, all-British, and ninety-five per cent. of the machinery was British. Sir Francis Floud, Permanent Secretary to the Ministry of Agriculture, said he was convinced that the granting of a subsidy to the industry was the best thing the Government had done for a hundred years.

**Brussels International Horticultural Exhibition.**—The International Horticultural Exhibition to be held in Brussels this year will take place in the Grand Hall du Cinquantenaire, from September 10 to September 19.

**The Artistic Value of Gardens.**—Mr. Owen Wallis, the manager of Messrs. Harrod's Estate Department, has issued a review of the property market during the year just ended, in the course of which he remarks upon the importance for the house-purchaser of finding a house with at least an acre or so of well-screened land in new districts where there is a danger that the erstwhile open country may be disfigured by too close building. He continues, "There is nothing more beautiful than trees, and, as a rule, the growing timber round the smaller country house is diversified . . . . There is at the same time a screen which excludes possible eye-sores, and something, too, which by judicious and inexpensive planting can be permanently maintained and improved, adding to the attractiveness of a house . . . . Bad building has put a premium on good gardening, for the latter may be an effective protection against the wrong done by the former. It is not practicable to buy the land immediately within the vista of a house, but careful and well-devised planting may make it a matter of comparative indifference as to what happens in the shape of development and disfigurement of neighbouring sites." While not entirely agreeing with the observation contained in the closing words given, there is no doubt that where a beautiful view is unavoidably spoilt, the best way to shut it out is by masking it with well-chosen plantations.

**Cemetery Art in Baden.**—At the end of April it is proposed to hold, in Karlsruhe, Germany, an exhibition of horticultural art as applied to cemeteries. It will be of an educational nature, and will have as its object the awakening among the public of a desire to improve the appearance of cemeteries, and an interest in this phase of gardening in general. The exhibition will consist largely of drawings, photographs, plans, etc., of cemeteries, with designs for new graveyards or the extension of existing ones. The exhibition will remain at Karlsruhe for four weeks, and will then be removed to other towns, thus reaching in time quite a large public.

**Kew Bulletin.**—Part 10 of the *Bulletin of Miscellaneous Information*, issued from the Royal Gardens, Kew, brings to a close the volume for 1926. The principal contents of this part, just issued, include a continuation of the "Decades Kewenses," Notes on African Grasses, Contributions to the Flora of Burma, Additions to the Flora of Malaya, The History of *Nepenthes laevis*, A New Variety of *Androsace maxima* (A. maxima var. *flavida*, from the arid hills south of Tabriz), reviews of books, and the title page, contents and index for 1926.

**Importation of Elm Trees.**—The Ministry of Agriculture and Fisheries has made an Order entitled, "The Importation of Elm Trees (Prohibition) Order of 1926," which prohibits the landing in England and Wales of all living Elm trees from any European country other than Scotland, Ireland, the Channel Islands and the Isle of Man. The Order is made to prevent the introduction of a disease of Elm trees which is prevalent on the Continent but unknown in this country. It comes into force to-day the 15th inst.

**William Willett Memorial.**—We learn that about £3,000 is still needed to complete the purchase of eighty-seven acres of Pett's Wood, Chislehurst, as a memorial to the late Mr. William Willett, the founder of the Daylight Saving scheme. In view of the rapid extension of building in this beautiful district, it will be a pity if the purchase cannot be completed, or if the acreage has to be drastically curtailed.

**A Veteran Oak.**—The fine old Oak tree illustrated in Fig. 25, is a conspicuous feature in the dressed grounds at Bocket Hall, Hertfordshire, and, according to tradition, Queen Elizabeth often sat under it when visiting Bocket from her residence at Hatfield, near-by. Mr. Pateman informs us that he recently measured the circumference of the trunk

20: Ipswich Gardeners' Association's meeting FRIDAY, JANUARY 21: British Florists' Federation's annual meeting and dinner; Dundee Horticultural Society's annual meeting; Manchester and North of England Orchid Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Chrysanthemums.*—E. Merry and Son, having devoted their attention entirely to the cultivation of this desirable autumnal flower, and being successful exhibitors at Stoke Newington and North London Societies in 1851, can with confidence recommend their selection as suitable either for exhibitional purposes or for general cultivation. The stock is of the most esteemed varieties, including the following selection, at the moderate price of 12/- per dozen,

FIG. 25.—THE OLD ELIZABETHAN OAK AT BROCKET HALL.

three feet from the ground and finds the girth to be thirty-one feet eight inches. With years the upper branches have lost much of their former vigour, but the tree is still an outstanding object of the pleasure grounds of this fine old estate, which includes an even larger Oak in another part. The photograph was taken in spring, when the grass banks leading down to the lake were beautiful with hosts of Daffodils and other bulbous flowers.

**Appointments for the Ensuing Week.**—TUESDAY, JANUARY 18: Winchester Horticultural Society's meeting. WEDNESDAY, JANUARY 19: Nottingham and Notts. Chrysanthemum Society's annual meeting; Royal Gardeners' Orphan Fund meeting; Sheffield Chrysanthemum Society's annual meeting. THURSDAY, JANUARY

package included:—Anaxo, Arc-en-ciel, Guillaume Tell, L'Admirable, Madame Audry, Madame Corbay, Miss Kate, Monge, Marshal Ney, Plutus, Ne plus Ultra, Racine, Rosa Mystica, Pio Nono. They have also a quantity of the best old varieties as follows, at 9/- per dozen: Beauty, Campestronii, Cyclops, Defiance, Dupont de l'Eure, Gem, Goliath, Duke, King, Lysias, Princess Marie, Salter's Phydias, Sydenham, Queen of England, Vesta. Early orders solicited to secure the stronger plants. A remittance is requested from unknown correspondents, or reference to a respectable house in London. Direct to E. Merry and Son, Florists, etc., Stamford Hill, Stoke Newington, Middlesex, or to their Agent, W. Clark, Seedaman, etc., 25, Bishopsgate Street Within, London. *Advertisement in Gard. Chron., January 17, 1852.*

the Union of South Africa, Australia and New Zealand. The list of prizes offered is a long one, and includes valuable presentations from the President of the French Republic, the Ministries of Public Instruction, Agriculture and Commerce, and a number of public authorities and societies.

**North and Central American Plants in the Sloane Herbarium.**—At the meeting of the Linnean Society, on the 6th inst., the President showed a series of lantern slides illustrating some of the early botanical collections from North and Central America contained in the Sloane Herbarium at the British Museum. These included a small collection of mosses and liverworts from Virginia, by the Rev. William Clerk (1729), and one of flowering plants from the same collector arranged in months according to the time of flowering; a collection of Joseph Lord from Carolina (1704) containing good specimens with neatly written descriptive labels; extensive collections from Carolina and Virginia in 1710 and 1711 by John Lawson, Surveyor-General of North Carolina from 1701 to 1711, who met his death in an expedition against the Indians in the latter year (many of the specimens bear Lawson's original labels with date, locality and other information, and references to his book, *A New Voyage to Carolina*) (1709); examples from James Petiver's *Hortus Siccus Americanus*, which was purchased by Sloane and forms part of his herbarium; (among these are specimens sent from the Scots Settlement in Darien by Archibald Stewart, surgeon, 1699); and collections from Maryland by the Rev. Hugh Jones, who died in 1701, a resident in Calvery County, Maryland, and by William Vernon and Dr. Kreig, who made a joint expedition to Maryland (1698) and brought home a large number of plants, which were catalogued by John Ray. Some of Ray's annotations are preserved with the specimens. They were later named by Dr. Solander, in whose manuscripts are descriptions of the novelties. Photographs were also shown illustrating a collection by William Bartram (1739-1823), and containing specimens of the plants mentioned in his *Travels through North and South Carolina, Georgia, &c.*, (1791).

**A Long-keeping Melon.**—Mr. A. J. Sanders, gardener to Col. Giles Loder, High Beeches, Handcross, Haywards Heath, has sent us such an interesting account of a long-keeping Melon that we publish his communication in full: "A very old friend of mine, Mr. A. Alderman, whose portrait appeared in these pages some time ago, sent me, in 1925, a few Melon seeds received from his son in South Africa. Some of the seeds were sown, with those of other sorts, in 1926, and the plants, when ready, were cultivated in the usual way in cold pits, wherein Violets are grown during winter. Early in September the few fruits remaining were cut and laid on a shelf at the back of a lean-to Muscat vinery; some ripened and were used, one or two shrivelled and were useless but two remained sound, both the produce of the South African seeds; one of these I sent to my old friend at the time, who wrote me a very charming letter in return. My one remaining Melon (South African variety) was examined from time to time; it kept its colour and remained sound; just before Christmas, 1926, I removed it from the shelf, and as it had an odour suggestive of ripening, I removed it to a house, where Lady Downes Grapes were still hanging, placing it directly over the hot-water pipes, which are kept just warm to suit the Grapes. On December 30, I again examined the Melon, and its pleasant odour suggested that I might risk sending it in to the house for dessert—especially as my employers had friends to dinner—and take the chance of a wiggling. The next day I was greatly surprised; the appearance of a Melon on the table had been the subject of interesting and favourable comment, and I was told that the fruit was quite equal in flavour to any eaten during the usual Melon season. I examined what little of the fruit remained and found it was perfectly sound flesh of a deep green colour and strongly aromatic. The seeds were quite plump and some of these I am saving, although I have some left in the original packet. The description on this packet reads: 'S.

Africa, 1925; green flesh, clear skin; one of the sweetest and finest-flavoured Melons I have ever tasted (Bert).' As a Melon out in September and used on December 30 seems to be something out of the common, I have penned these few lines and should like to know if any of your many readers have had a similar experience of the keeping qualities of a Melon. Perhaps this particular variety only has that quality."

**Mr. Robert L. Harrow, V.M.H.**—For over thirty years, Mr. R. L. Harrow has demonstrated his skill as a cultivator at the Edinburgh Botanic Garden, but he has carried out his work so unostentatiously that certain folk who are not acquainted with that famous garden may have been surprised to learn that he has been awarded the Victoria Medal of Honour in Horticulture. His many friends, however, have wondered why the honour was so long delayed. Mr. Harrow had an excellent training for the position he occupies at Edinburgh, a position corresponding to that of Curator

MR. ROBERT L. HARROW, V.M.H.

at Kew and elsewhere. He is a native of Kent, and his training began in the gardens of Heronden Hall, Tenterden; while still in his teens he obtained employment with Messrs. B. S. Williams and Son, at Holloway, where he became acquainted with the large numbers of plants then grown under glass in a high-class nursery. His next post was that of journeyman at Neville Court, Tunbridge Wells, where he remained three years before going to Leyswood, Groombridge, where Orchids were made a special feature. Following three years at Leyswood, Mr. Harrow went to the Botanic Garden, Cambridge, where, under the late Mr. I. Lynch, his knowledge of plants was greatly increased, and he gained a good working knowledge of botany and of the methods of propagating and preparing plant material for the services of the University. In 1891 he entered Kew, with high recommendations from Mr. Lynch, and became sub-foreman of the Fernery Department. Two years or so later, Sir Isaac Bayley Balfour, Regius Keeper of the Edinburgh Botanic Garden, was, with the consent of the Treasury, preparing to rebuild the range of glasshouses there, and came to Kew in search of a young man to take charge of that department; Mr. Harrow was chosen on the recommendation of Sir William Thistlethorn Dyer. A few years later he was appointed Assistant Head Gardener at Edinburgh, and on the resignation of Mr. A. D. Richardson he was given that full charge he has so eminently justified. During his long stay at Edinburgh, Mr. Harrow has seen many changes in the Botanic Garden and has taken

his full share in the alterations and improvements made under glass and out-of-doors, while his associations with the late Sir Isaac Bayley Balfour and the present Keeper, Professor W. Wright Smith, have always been of the pleasantest.

**Annuity for a Gardener.**—In his will, the late Rev. W. D. Rudgard, rector of Longford, Warwickshire, who died last October, left an estate of over £25,000. The income is to be equally divided between his gardener, Mr. William Sephton, his secretary and his housekeeper, for life.

**Glasgow Flower Show.**—An application by the Directors of the Glasgow and West of Scotland Horticultural Society for the use of the new Kelvin Hall on the occasion of the annual exhibition in the first week of September has been refused by the Corporation, as the Committee were unable to pledge themselves that the new hall, now in course of erection, would be ready in time. A meeting of the Directors has been called to consider the position, which is similar to that of a year ago, when it was decided to hold the 1926 show in St. Andrew's Hall, but as a financial loss of over £300 was incurred on that occasion, it is probable that the list of classes will be further restricted, and the prize-money reduced so as to avoid a repetition of last year's shortage, which was not due to any decline in public patronage. Mar-quees provide an alternative, but there might be a difficulty in obtaining a suitable site, and the weather in September involves considerable risks.

**National Rose Society's Summer Show.**—The summer show of the National Rose Society will be held in the grounds of the Royal Hospital, Chelsea, on Friday and Saturday, July 1 and 2.

**Horticultural Club.**—The opening dinner and lecture of the Winter-Spring Session, 1927, of the Horticultural Club took place on Tuesday last at the Trocadero Restaurant, Piccadilly Circus, London, and was a great success. The company numbered forty-four; Mr. Gerald Loder, Chairman of Committee, presided, and amongst the guests were Lt.-Col. F. R. Durham, Secretary of the Royal Horticultural Society, and W. R. Oldham, Esq., a member of the Council of the Royal Horticultural Society. After the dinner, Mr. Wm. Cuthbertson, V.M.H., gave an address on "Some Horticultural and Other Notes Gleaned on a World Tour." Mr. Cuthbertson's remarks were very entertaining, and regret was expressed at the close that he had not been able, owing to limitations of time, to give an account of his journeys beyond India; many expressed the wish to hear an account of horticultural conditions in New Zealand and Canada, which Mr. Cuthbertson promised to give on a future occasion. The Chairman said the meeting was the most successful for a long time; in welcoming the guests he took the opportunity of congratulating Colonel Durham on his recent engagement to be married, and he hoped that on another occasion he would be present with his wife. Mr. Loder, in thanking Mr. Cuthbertson, whom he referred to as one of the best-known men in the horticultural world, expressed the great pleasure all had derived from his interesting address.

**Fifth International Botanical Congress, 1930.**—A meeting is to be held in the Linnean Society's Rooms at Burlington House, Piccadilly, on Thursday, January 27, at 3.30 p.m., to initiate arrangements for the fifth International Botanical Congress to be held in 1930.

**Sugar Beet in Yorkshire.**—The increase in Sugar Beet cultivation in mid-Yorkshire led to the erection of a factory at Poppleton, where work was commenced last October. The formal opening took place last Friday, when the ceremony was performed by Lady Invernairn, the wife of Lord Invernairn, of Strathnairn, one of the Directors of the Second Anglo-Scottish Beet Sugar Corpora-

tion, which owns the new factory. During the short time the Poppleton factory has been working, 50,000 tons of Beet, yielding 6,000 tons of sugar, has been sliced. The daily capacity of raw Beet dealt with is 1,000 tons, and 400 men are employed. At the opening ceremony Lord Weir, Chairman of Directors, stated that the company made a point of being, so far as possible, all-British, and ninety-five per cent. of the machinery was British. Sir Francis Floud, Permanent Secretary to the Ministry of Agriculture, said he was convinced that the granting of a subsidy to the industry was the best thing the Government had done for a hundred years.

**Brussels International Horticultural Exhibition.**—The International Horticultural Exhibition to be held in Brussels this year will take place in the Grand Hall du Cinquantenaire, from September 10 to September 19.

**The Artistic Value of Gardens.**—Mr. Owen Wallis, the manager of Messrs. Harrod's Estate Department, has issued a review of the property market during the year just ended, in the course of which he remarks upon the importance for the house-purchaser of finding a house with at least an acre or so of well-screened land in new districts where there is a danger that the erstwhile open country may be disfigured by too close building. He continues, "There is nothing more beautiful than trees, and, as a rule, the growing timber round the smaller country house is diversified . . . There is at the same time a screen which excludes possible eye-sores, and something, too, which by judicious and inexpensive planting can be permanently maintained and improved, adding to the attractiveness of a house . . . Bad building has put a premium on good gardening, for the latter may be an effective protection against the wrong done by the former. It is not practicable to buy the land immediately within the vista of a house, but careful and well-devised planting may make it a matter of comparative indifference as to what happens in the shape of development and disfigurement of neighbouring sites." While not entirely agreeing with the observation contained in the closing words given, there is no doubt that where a beautiful view is unavoidably spoilt, the best way to shut it out is by masking it with well-chosen plantations.

**Cemetery Art in Baden.**—At the end of April it is proposed to hold, in Karlsruhe, Germany, an exhibition of horticultural art as applied to cemeteries. It will be of an educational nature, and will have as its object the awakening among the public of a desire to improve the appearance of cemeteries, and an interest in this phase of gardening in general. The exhibition will consist largely of drawings, photographs, plans, etc., of cemeteries, with designs for new graveyards or the extension of existing ones. The exhibition will remain at Karlsruhe for four weeks, and will then be removed to other towns, thus reaching in time quite a large public.

**Kew Bulletin.**—Part 10 of the *Bulletin of Miscellaneous Information*, issued from the Royal Gardens, Kew, brings to a close the volume for 1926. The principal contents of this part, just issued, include a continuation of the "Decades Kewenses," Notes on African Grasses, Contributions to the Flora of Burma, Additions to the Flora of Malaya, The History of *Nepenthes laevis*, A New Variety of *Androsace maxima* (A. maxima var. *flavida*, from the arid hills south of Tabriz), reviews of books, and the title page, contents and index for 1926.

**Importation of Elm Trees.**—The Ministry of Agriculture and Fisheries has made an Order entitled, "The Importation of Elm Trees (Prohibition) Order of 1926," which prohibits the landing in England and Wales of all living Elm trees from any European country other than Scotland, Ireland, the Channel Islands and the Isle of Man. The Order is made to prevent the introduction of a disease of Elm trees which is prevalent on the Continent but unknown in this country. It comes into force to-day the 15th inst.

**William Willett Memorial.**—We learn that about £3,000 is still needed to complete the purchase of eighty-seven acres of Pett's Wood, Chislehurst, as a memorial to the late Mr. William Willett, the founder of the Daylight Saving scheme. In view of the rapid extension of building in this beautiful district, it will be a pity if the purchase cannot be completed, or if the acreage has to be drastically curtailed.

**A Veteran Oak.**—The fine old Oak tree illustrated in Fig. 25, is a conspicuous feature in the dressed grounds at Bocket Hall, Hertfordshire, and, according to tradition, Queen Elizabeth often sat under it when visiting Bocket from her residence at Hatfield, near-by. Mr. Pateman informs us that he recently measured the circumference of the trunk

20: Ipswich Gardeners' Association's meeting FRIDAY, JANUARY 21: British Florists' Federation's annual meeting and dinner; Dundee Horticultural Society's annual meeting; Manchester and North of England Orchid Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Chrysanthemums.*—E. Merry and Son, having devoted their attention entirely to the cultivation of this desirable autumnal flower, and being successful exhibitors at Stoke Newington and North London Societies in 1851, can with confidence recommend their selection as suitable either for exhibitional purposes or for general cultivation. The stock is of the most esteemed varieties, including the following selection, at the moderate price of 12/- per dozen,

FIG. 25.—THE OLD ELIZABETHAN OAK AT BROCKET HALL.

three feet from the ground and finds the girth to be thirty-one feet eight inches. With years the upper branches have lost much of their former vigour, but the tree is still an outstanding object of the pleasure grounds of this fine old estate, which includes an even larger Oak in another part. The photograph was taken in spring, when the grass banks leading down to the lake were beautiful with hosts of Daffodils and other bulbous flowers.

**Appointments for the Ensuing Week.**—TUESDAY, JANUARY 18: Winchester Horticultural Society's meeting. WEDNESDAY, JANUARY 19: Nottingham and Notts. Chrysanthemum Society's annual meeting; Royal Gardeners' Orphan Fund meeting; Sheffield Chrysanthemum Society's annual meeting. THURSDAY, JANUARY

package included:—Anaxo, Arc-en-ciel, Guillaume Tell, L'Admirable, Madame Audry, Madame Corbay, Miss Kate, Monge, Marshal Ney, Plutus, Ne plus Ultra, Racine, Rosa Mystica, Pio Nono. They have also a quantity of the best old varieties as follows, at 9/- per dozen: Beauty, Campestronii, Cyclops, Defiance, Dupont de l'Eure, Gem, Goliath, Duke, King, Lysias, Princess Marie, Salter's Phydias, Sydenham, Queen of England, Vesta. Early orders solicited to secure the stronger plants. A remittance is requested from unknown correspondents, or reference to a respectable house in London. Direct to E. Merry and Son, Florists, etc., Stamford Hill, Stoke Newington, Middlesex, or to their Agent, W. Clark, Seedsman, etc., 25, Bishopsgate Street Within, London. Advertisement in *Gard. Chron.*, January 17, 1852.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Miltonias.**—The species and natural hybrids of the Brazilian section of Miltonias, which include such well-known species as *M. spectabilis* and its variety *Moreliana*, should be examined, and any of the plants in need of new rooting material attended to, as the present is the proper season to repot them. Being dwarf plants they are best grown in shallow pans, which are easily suspended from the roof-rafters. In repotting the plants it is advisable to remove all the old and useless pseudo-bulbs, and to arrange the growing, healthy portions afresh into neat, compact specimens, allowing the leading growths room to extend over the compost, as they are apt to grow over the sides of the pans and get damaged. Portions which have few roots to hold them in position should be pegged firmly to the compost as they will not succeed if loose in the soil. The larger-growing species, such as *M. Regnellii*, *M. Clowesii*, *M. Russelliana*, *M. bicolor*, *M. Lamarekiana*, and *M. candida*, are best grown on the plant stage in pots. *M. cuneata*, which is one of the best of this section, should not be disturbed until its flowering period is over.

**Treatment after Potting.**—The whole of these Brazilian Miltonias grow satisfactorily in a shady position in a house having an intermediate temperature. Direct sunshine often causes the foliage to assume a yellow, sickly appearance, and although this is perfectly natural, it is not advisable to allow it to become too pronounced by exposure to an excess of light. The pots and pans should be at least half-full of drainage material, as these plants, when in full growth, delight in an abundance of water at the roots, but they do not succeed in a close, water-logged compost. *Osmunda* fibre and A.I. fibre in equal parts, cut into fine portions, and mixed with live Sphagnum-moss, provide a suitable compost. This open material should be placed rather firmly around the rhizomes of the plants.

**Watering.**—For some little time, water should be afforded with extreme care, as the young growths are liable to decay if too much moisture is given, while an excess will ruin the compost for ever. When thoroughly re-established in the new material, the plants should be kept moist until their growth is completed.

### THE KITCHEN GARDEN.

By E. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WYVETREE, Horsley Hall, Gresford, N. Wales.

**Exhibition Onions.**—Round about this date is a good time to sow Onions required for exhibition. The soil should consist of two parts good loam, one part leaf-mould, and sufficient silver sand to render the compost porous. Pass the materials through a fairly fine sieve. Prepare boxes or pots by carefully crocking them, and cover the crocks with sufficient rough material to prevent the fine soil blocking them. Place the prepared soil firmly in the receptacles leaving a space of three-quarters-of-an-inch at the top. Select good, plump seeds, sow them evenly and thinly, cover them sparingly with very fine soil, and carefully water them in. Sheets of glass and paper should be placed over the boxes; the covering should be removed for a short time each day and condensed moisture wiped off the glass. The seeds will germinate freely in a temperature of 50° to 53°. So soon as seedlings appear remove the coverings, place the pots or boxes near the roof-glass, and thus keep the plants quite sturdy from the beginning, for this is very essential to success. Good varieties are Premier, Ailsa Craig and Cranston's Excelsior.

**Mushrooms.**—Successional crops of this useful fungus should be maintained. Collect fresh horse-manure daily from the stables and spread the same thinly in a dry, open shed, until a sufficient quantity is obtained. The manure should then be thrown together in a heap to ferment, turning it at intervals of four or five days until it is in a suitable condition, that is, when pressed together with the hand no superfluous moisture will be present. This latter point is very essential, for if the manure is too wet, success will not be obtained. In forming the beds tread or beat the manure firmly. The depth of the manure need not exceed fifteen inches. When all is finished, a plunging thermometer should be placed in the bed, and so soon as the temperature declines to 83° it will be safe to insert the spawn. The bricks of spawn should be broken into pieces of about two inches and inserted in the bed, about one inch deep and nine inches apart. When the bed has been spawned, beat the manure to make it quite firm again. At this time, or within a couple of days, the surface should be covered with good loamy soil to a depth of about two inches, and again beaten quite firmly. This is most conveniently done with the back of a clean spade or shovel. When finished, cover the bed with clean straw, and if all goes well, Mushrooms should appear in from six to seven weeks.

**Asparagus.**—Strong roots of Asparagus should be lifted carefully and placed either on hot-beds in heated frames or in a Mushroom house; I obtain good results in the latter. Arrange the roots on a bed of leaf-mould, three or four inches in depth, and cover the crowns with the same material. Keep the plunging material moist and force the crowns in a temperature of about 55°. Good shoots will be ready for cutting in from three to four weeks.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Pot Vines.**—The earliest pot vines will now be making rapid progress; let the forcing be done as much as possible during the day. The temperature may be 55° on cold nights, and 60° on mild ones until the vines come into flower, when 65° to 68° should be maintained with 5° or 10° higher by day with bright sun. Damp all available spaces when the house is closed for the day. Water the vines carefully with tepid water, giving the roots weak stimulants and light top-dressings of vine manure as frequently as they appear to be necessary. Keep the bottom-heat steady at about 80°, adding more fermenting materials if necessary. Do not be in a hurry to tie the shoots if the foliage can be kept clear of the glass, as later they may be drawn down with safety.

**Permanent Vines.**—Many of the cultural details recommended above for pot vines apply also to vines growing in borders. In many establishments this will be the first house to be closed for starting. See that the borders are in a moderately moist condition; a liberal application of tepid water should be given prior to the vines coming into flower, but the amount of atmospheric moisture should be reduced slightly. Close the house when the temperature is at the maximum. All shoots should be stopped at the first joint beyond the bunch on pot vines, and at the first or second shoot, according to the space available, on permanent vines. Minor laterals may be pinched and regulated according as is necessary.

**Melons.**—The present is a suitable time to get together a good heap of leaves and stable litter to form a hot-bed for growing Melons. Unless suitable pits or houses are available it is almost useless to attempt to grow perfect Melons, and nothing much is gained in sowing before this date. Let the houses be cleansed thoroughly and all brick surfaces well covered with hot linewash into which a handful of sulphur has been stirred. Sow the seeds singly in small pots, germinate them in a temperature of 68° to 70°, and plunge the seed-pots in a brisk bottom heat. The thermometer may be allowed to rise to 75° to 80° by day, according to the

weather. Select an early-maturing and free-setting variety and grow the plants for preference in twelve-inch pots, plunging them closely together. Crop two fruits only to a plant, and, if possible, both should set on the same day.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Winter-flowering Begonias.**—Winter-flowering Begonias of the Mrs. Heal, Optima and Elatior type will, in most cases, have passed out of flower by this date, and during their resting period the plants will require careful treatment. I do not advise cutting these Begonias down, rather allow them to die back as naturally as possible. Although care must be exercised with regards to watering, it will be found necessary to give them sufficient moisture to prevent them from drying off completely. Much will depend on the treatment these plants receive during the next two months with regards to growing them successfully during the coming season. Where the Begonia mite is inclined to be troublesome, now is a suitable time to eradicate this pest by vapourising the plants several times during the resting period with sulphur. Campbell's vapouriser will be found the best means of distributing the powder, and it should be used in strict accordance with the directions given by the makers. The whole secret of success in growing these Begonias well is to keep them free from rust and mite, and I have found nothing to equal sulphur to combat both the disease and the pest.

**Begonia Gloire de Lorraine.**—As these plants pass out of flower it will be wise to select the most robust specimens for stock purposes. They should be cut back and watered sparingly for a short time; treated in this manner they will start into growth more vigorously than over-watered plants, and produce excellent cuttings for the propagation of next season's stock.

**Flowering Bulbs.**—Examine all bulbs in pots and boxes that still remain in the plunging material, and those that have made sufficient root and top growth should be placed in a cold frame. The latter should be covered with some light material for a day or so, after which the plants may be gradually exposed to the light. Continue to introduce into warmth sufficient quantities of plants in pots and boxes as are required to meet the week's demands of the establishment, always bearing in mind the conditions under which these plants will thrive best, and so give the maximum returns. It should also be remembered that cut flowers last better in hot rooms when they are just opening than those that have been expanded a week previous to gathering them.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STAFFORD  
Wrotham Park, Barnet, Middlesex.

**The Orchard.**—All work in connection with the planting of fruit trees should receive immediate attention, for as the season advances it will bring pressing work of other kinds. On some soils planting is best deferred until next month; much, however, depends on the nature of the land and the weather. The ground should be drained thoroughly and well broken up for a good distance around where the trees are to be planted. In some cases a quantity of fresh, fine soil will be needed to place about the roots. In preparing the stations for the individual trees it is well to provide against the main roots growing downwards into a cold and inert sub-soil. Use farmyard manure sparingly if the soil is in good heart, but if the land is of a poor, sandy character, mix well-decayed manure thoroughly with the staple to encourage the young trees to produce good, fruitful growth. In planting young trees in low-lying land, whether bush or standard specimens, keep the roots well above the natural soil, stake the trees to prevent damage by high winds and mulch the roots with manure.

**Pruning Newly-Planted Trees.**—The question as whether to prune or not to prune trees the first year after planting is a debatable one. I have pruned and left unpruned newly-planted trees and am satisfied that pruning is the right course to adopt. Until the heads are formed always prune to a bud pointing to the outside of the tree.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Aubrietias.**—Where these floriferous plants are used in large quantities for spring bedding, means should be taken to propagate the required stock. I find the best and least troublesome method is to pull the stock plants to pieces any time during the winter or early spring and plant the portions in lines in the nursery garden. By this method fine, large clumps are available for planting out by autumn. New or scarce varieties should be propagated from cuttings. One frequently hears cultivators complain that cuttings of Aubrietias are difficult to root, and there is a good deal of truth in their contention when the cuttings are taken from plants grown out-of-doors. If, however, the plants are grown indoors in a temperature of 50° to 55°, and encouraged to make fresh growth, the young shoots may be rooted as readily and in the same way as ordinary bedding Lobelias. Plants raised in this way at this time, hardened off and planted out during April or May, should make fine, large specimens for autumn planting.

**Phloxes.**—The many fine varieties of the border Phlox are invaluable for making a display of bright flowers, either in beds or borders, by themselves, or for grouping in the mixed or herbaceous border. During open weather young stock may be planted, or the old clumps replanted, which is necessary if they are suffering from attacks of eel-worms. Some of the weaker-growing varieties are very liable to be attacked by this pest, against which liming and fresh soil are necessary. The ground for Phloxes should be cultivated thoroughly and manured heavily, as they are gross feeders; in addition to plenty of well-decayed farmyard manure, bone meal at the rate of six ounces to eight ounces per square yard should be forked in the soil. The best results are obtained from young plants raised from cuttings the previous spring; this is much better than dividing the old clumps, which get hard and woody. If young stock is not available the outer or younger portions of the old clumps should be selected for replanting, rejecting the hard and worn-out central portions. The cuttings inserted in spring should be about three inches in length. Dibbled into cold frames they will form roots quickly, and later may be transferred to the nursery garden, where they will make a fine show towards the end of the season. They are very accommodating plants; young stock may be lifted and transferred to beds in the garden just before coming into flower, without taking any harm, provided the roots are well-watered. It is a good plan to raise a batch from seeds each year, as many fine varieties are obtained in this way, and seedlings, as a rule, are very vigorous.

**Planting.**—The constant wet weather during November did much to retard planting operations, even on light, workable soils, thus every favourable opportunity should be taken to complete arrears. Light, well-drained soils present few difficulties, as they dry out quickly; on the contrary, it is a mistake to attempt planting on heavy, wet land until the conditions are favourable. With care and forethought, however, many of the difficulties may be overcome; for example, it is unwise to take out holes until the planting can actually be done, for even if it does not rain, water may drain in from the surrounding soil. Where planting has to be done under such adverse conditions, there should always be a quantity of light, dry soil at hand to place around the roots, and, if sufficient, to mix with the heavier staple. By using plenty of light soil about the roots, the plants will form new roots and become established much quicker than they would do if planted direct in the natural heavy medium.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Bulbs in Pots.**—If the bulbs were potted early last autumn, and treated as advised in previous calendars, they will be well-rooted and may be brought into the forcing house to form a succession to the earlier batch which is now nearly over. Hyacinths, Tulips, Narcissi and other bulbous plants provide a display of bright flowers during the early months of the year and form a strong link in the unending stream of flowering plants that are necessary to keep the conservatory and greenhouse gay all the year round. Lily-of-the-Valley which may be had in flower from retarded

shades of colourings, they are all beautiful and may be included in gardens where Ericas grow well. Some of the earlier-flowering species and varieties are *E. praecox rubra*, *E. gracilis*, Winter Beauty, Queen Mary, King George and Queen of Spain. The following sorts are, with us, distinctly later in coming into flower, but useful in forming a succession:—*J. Backhouse*, *Pink Pearl* and *T. Kingscote*. These plants may all be increased readily by layering, and quite useful specimens may soon be obtained by placing a compost of peaty soil around the clumps and securing the shoots to the soil by means of pegs. These layers should not be disturbed for twelve months; by that time they may be lifted with good roots.

FIG. 26.—ASYSTASIA (SYN. MAKAYA) BELLA.

(see p. 46.)

clumps in three or four weeks from the time the crowns are taken from cold storage, is always appreciated, and home-grown crowns may still be lifted and potted to furnish successional flowers. Freesias should be well-advanced in growth, but these are best grown in cool conditions, as, if subjected to much heat, they become drawn and useless. Expose them fully to the light and endeavour to keep the growths sturdy and strong by admitting air to the house on all suitable occasions.

**Erica carnea.**—This useful Heather is making a fine display in the borders and should be more widely planted, as any plant that can be relied on to produce its normal crop of flowers during winter is doubly welcome. The rosy-pink blooms are quite distinct from the usual range of colours found amongst outside winter flowers. Many hybrids of this plant were raised a number of years ago by Messrs. Backhouse, Ltd., York, and while these have distinct habits and different

**Peas and Broad Beans.**—Where soil conditions permitted of these vegetables being sown out-of-doors during November, the young plants should be carefully watched, as they are peculiarly attractive to a host of enemies. Birds of various kinds soon destroy a promising "braird," and mice and rats will do irreparable damage even before the seedlings are through the soil, while slugs must be prevented by every available means from damaging the young and tender shoots. In view of all these difficulties many resort to sowing the earliest batches of Peas and Broad Beans under glass in January, either in pots or boxes in a house. The young plants may be more or less secured from adverse conditions and transferred to their growing quarters when weather conditions are more in their favour. The growing of French Beans under glass is an industry in some parts, and a few pots of these Beans may be sown now to provide early supplies, to be succeeded by later sowings.

## INDOOR PLANTS.

## CRASSULA MULTICAVA.

THE merits of this delightful plant are such that it deserves to be much more widely known and more generally cultivated than at present, and it is worthy of inclusion in any list of flowering plants for a cool greenhouse or conservatory. Its season of blooming enhances its value, for its myriads of tiny, white flowers, borne on branching stems, appear very shortly after the advent of the New Year.

The habit of the plant is perfect; it is of rather low, bushy growth, and the flowers are carried well above the handsome, bold foliage. The glabrous leaves are rounded, rather succulent, and bright green in colour.

It remains in bloom for a very considerable period, and then, instead of seeding, a tiny plantlet is produced in place of each individual flower. If it is desired, propagation may be readily effected by means of these plantlets, but as numerous basal shoots are produced, these form a quicker and better means of increase.

Cuttings, inserted in a sandy compost about March, root very easily; they should not be placed in a close propagating case, but in a light position in an intermediate house. After they are rooted they may be potted on as required; use ample drainage and a porous compost, mixed with a liberal amount of old mortar-rubble. For the final potting they may be placed either singly in four-inch pots, or three together in a six inch pot.

During the summer they should be grown in cool conditions, either in a frame or a cool house, and placed in a position where they will receive all the sunshine available. In September they should be removed to a light position in a house having a minimum temperature of 45° to 50°. When the pots become full of roots, the latter may be fed with stimulants. *T. H. Everett.*

## HIPPEASTRUM RETICULATUM.

THE median white band on the upper surface of the dark green leaves of this Brazilian bulbous plant is a conspicuous feature and a distinguishing character when it is out of flower. It is less robust-growing than the many garden hybrid *Hippeastrums*, the leaves being considerably shorter and blunt at the apex. It usually flowers in autumn.

The scape grows from one foot or fifteen inches high and bears four to six flowers each three inches in diameter and of a clear shade of pink pencilled with darker lines.

The bulb is on the small side and has a very little neck. Several bulbs may be planted together in a six-inch half-pot or pan, or individual bulbs may be grown and flowered in receptacles four inches in diameter. *J.*

## DIPLADENIAS.

It is, perhaps, unnecessary to speak of the beauty of the Dipladenias, for whether grown on the roof-rafters for the embellishment of the stove, or as specimens in pots, trained on trellises, they are unsurpassed in effectiveness when well-flowered. They are, in fact, so pre-eminently good in every respect that space should be set apart for a few good specimens in every collection of stove plants grown for their flowers.

To grow good Dipladenias, a considerable amount of care and attention is necessary throughout the growing season. One of the essential points in their cultivation is to encourage vigorous growth early in the year to ensure the shoots being thoroughly ripened by the end of the summer, hence the plants should be repotted rather early in the spring and placed in the warmer end of the stove, where a temperature of about 70° can be maintained, rising another 5° in sunny weather.

The plants should be syringed occasionally with tepid water, and frequent damping of the floors, etc., should be practised to promote a humid atmosphere favourable to vigorous growth.

So soon as the young shoots have made considerable progress, the plants should be

stood in a light position as near the roof-glass as possible to promote firm, short-jointed growth. During the time they are in flower, i.e., from June to October, they may be placed in an intermediate temperature and the flowers protected from the sun. After the flowering season is past they should be again returned to the stove.

A suitable compost may be prepared by mixing fibrous loam and peat in equal proportions, adding charcoal nodules and sharp sand in liberal quantity. The compost should be used in a rather lumpy state and every particle of fibre retained to assist in keeping the soil open and porous. When the plants are in active growth liberal supplies of water at the roots will be necessary, hence the drainage must be perfect to prevent the possibility of the soil becoming sour. During the winter, when the plants are at rest, very little water is required.

Propagation is effected by cuttings of young shoots taken when new growth commences in the spring. The cuttings should be inserted in a sandy compost and placed in the propagating case in brisk bottom-heat. Roots are soon formed and the young plants may then be potted and grown on as required.

*D. amabilis*, a garden hybrid, is a glorious plant, bearing large, rosy-crimson flowers in clusters; *D. Brearleyana* is also a garden hybrid of great beauty its large, rich crimson flowers being produced with remarkable freedom; *D. splendens* has delicate, blush flowers, with a deep rose-coloured throat, borne on spikes which keep extending for a long time; *D. boliviensis* is a small-growing but very pretty species, bearing white flowers with deep yellow throats in profusion; *D. atropurpurea* is short-jointed in growth, has small leaves and rich crimson-purple flowers. *A. P. C.*

## ERIOSTEMON BUXIFOLIUS.

*ERIOSTEMON buxifolius*, which was shown at the Chiswick exhibition in 1848, although not common, is occasionally seen in gardens. It is an easily-grown subject and very floriferous when well-grown.

The light pink flowers are borne in clusters of from one to four, along the growths in the axils of the closely-set, green, pointed leaves.

Cuttings inserted early in spring root quickly in heat, and after being hardened they may be grown on in cooler quarters.

When the plant is re-established after its first potting, the point of the leading shoot should be removed to induce several growths to develop from the base. If transferred later to five-inch pots, the plants will flower in their second year and, potted annually, will eventually form specimens several feet high.

After flowering, the plants should be given every encouragement to make strong healthy growth, which, if well-ripened, will be wreathed with blossom the following spring. Very careful watering is essential in the successful cultivation of this indoor subject. *F.*

## ASYSTASIA BELLA.

THIS beautiful greenhouse flowering shrub (Fig. 26) is best known to our readers under its old name, *Mackaya bella*, after Dr. J. F. Mackay, author of *Flora of Hibernica*. Benthams and Hooker, however, place the plant in the genus *Asystasia*, and as such, it is included in the *Index kewensis*.

A well-flowered specimen of this plant is very beautiful, but apparently some growers experience a difficulty in flowering it satisfactorily. One of the secrets of success appears to be giving the plant a decided rest in winter, so that the shoots may become well ripened. After the resting period, the plants should be introduced into a warm house and with suitable treatment they will flower freely in March.

The blooms are produced from the ends of the shoots of the previous season, and this should be remembered when the growths are pruned, which should be done when the flowers are over; the shoots should be cut back to within two inches of their origin, and directly the plants begin to grow freely, they should be shaken out of their pots and repotted in a rich compost containing dry cow manure.

As the season advances they should be fed liberally with liquid manure.

Cuttings will root readily in a warm greenhouse in April, and if they are potted on they will flower the following season. The old plants should be transferred to larger pots as required and in time will make extremely handsome specimens. The roots should never be allowed to become dry during the season of active growth, and as much water is necessary when the plants are growing freely, the pots should be well-drained to ensure the soil from becoming stagnant. *T.*

## AERIDES AND ALLIED PLANTS.

MANY years ago, no collection of Orchids was complete unless it included examples of *Aerides* and allied kinds; now, however, a plant is rarely seen; when one is flowered it is greatly admired.

The elegant, drooping racemes of fragrant, fleshy flowers are extremely beautiful, and the comparative ease with which the several species may be cultivated makes the general decline of their popularity all the more remarkable. Although the flowers do not adapt themselves to cut flower purposes, the plants are very decorative in a warm house.

Alas! these plants are rarely found in the condition seen in the old days, with foliage down to the top of the pot; an odd plant is seen with bare stems, a foot or more in length, carrying a few pairs of leaves at the top. Their decline in popularity may be due to their requiring the heat of the hottest house the whole year round; while at the present time there is a general tendency to cultivate plants needing cooler treatment.

The sorts most generally grown comprise *Aerides affine*, *A. crispum*, *A. Houlletianum*, *A. Lobbiai*, *A. odoratum*, *A. Savaganum*, *A. Larpenae*, *A. suavisimum*, *A. Fieldingii* and *A. Lawrencei*; *A. maculosum* and its variety *Schröderi* will succeed satisfactorily in a shady corner of the Cattleya house.

From now until the end of February—not later—is the best time to repot or top-dress any plants that require it. An ordinary flower pot with holes for suspending makes the best receptacle, the plants being more easily managed and the roots less disturbed than when wooden baskets are used. When repotting, pick out all the old decayed moss, and if any roots are clinging to the sides of the pot they should be carefully detached with a sharp knife. A suitable compost consists of equal portions of *Osmunda-fibre*, cut up rather finely and thoroughly cleaned, and *Sphagnum-moss*, with sufficient broken crocks to render the mixture porous. The pots should be well-drained and the roots worked in amongst the crocks, finishing with two or three inches of compost, according to the size of the pot, the whole to be made moderately firm.

Water should be applied carefully for some time, only sufficient to keep the moss in a living state being necessary. On fine, bright days a slight spraying will be beneficial, but during the hot summer days, when the plants are thoroughly re-established, syringing twice a day is advisable, and it will keep them free from insect pests.

There are some little differences in the requirements of the different species, but the observant cultivator will soon detect these.

*Saccolabium* include upwards of forty species, many of which are of botanical interest only, but *S. ampullaceum*, *S. bellinum*, *S. curvifolium*, *S. Hendersonianum* and *S. violaceum* are worth a place in a collection.

The genus *Rhynchosstylis* includes some of the most beautiful of this class of plants, and they were formerly grown under the name of *Saccolabium*. The best are *R. coelestis* and *R. retusa*, of which there are several varieties.

The cultural treatment of *Aerides*, *Saccolabium* and *Rhynchosstylis* are identical, as all require the highest temperature usually maintained in glasshouses and a constantly moist atmosphere that should approach saturation during the growing season. *J. T. B.*

## HARDY FLOWER BORDER.

## SILENE ASTERIAS GRANDIFLORA.

AN uncommon *Silene*, or Catchfly in gardens, is that called *Silene Asterias grandiflora*. It is an improved variety of an old-fashioned garden plant, and has practically superseded the old *S. Asterias*; yet one may go into hundreds of gardens without seeing either the old one or the improved variety. I remember a good many years ago, a short controversy arose regarding its duration of life. The discussion did not last long, however, as few people were in a position to speak with practical experience of the plants. At that time the writer grew *S. Asterias grandiflora*, which he had raised from seeds, and he had no hesitation in saying that it was a perennial, while others stated positively that it was a biennial.

I observe in a generally reliable list of hardy flower seeds that *S. Asterias grandiflora* is said to be a perennial which will flower the first year from seeds if sown early. The writer has never sown it early in heat, but he knows that it will flower the second year if sown in the open in April or May. It is a distinct, though not showy, plant, if seen in solitary specimens, and is much better planted in clumps of a dozen or more, so that raising from seeds is the most economical method of securing a clump or group. The plant grows about a foot-and-a-half high, and gives large, globular, heads of crimson flowers. The writer cannot contend that it is in the front rank of border flowers, but it is a subject worth growing and worth knowing.

## RUDBECKIA HIRTA.

THIS, the Hay-scented Coneflower, is a capital border plant, not too well-known, but a pleasing species when compared with the other *Rudbeckias* more commonly cultivated. It is a summer-flowerer, also, and its moderate height and distinctness render it acceptable to a good many cultivators of hardy flowers. It grows about two feet high only, although I have had it rather taller. It is distinct by reason of its downy appearance, caused by the small hairs on its foliage, whence it derives its specific botanical name. The flowers are of a good size and are of a fine orange with a dark centre, not so much elevated as that of some of the other *Rudbeckias*. It has received its popular name of the "Hay-scented" Coneflower from the fact that the whole plant smells faintly of new-mown hay.

*R. hirta* is quite a good hardy perennial, and will thrive in any common border soil. With the writer, it appeared to be happier in a rather poor and dry place than in a border or richer compost and with more moisture. It will succeed for several years without disturbance, if required, but if it should show any signs of exhaustion the clump may be lifted and divided, replanting the more vigorous outgrowths. It is increased by division or by seeds, which may be obtained from some seedsmen. If seeds are sown in good time they will produce plants that will bloom the following year. *S. Arnott.*

## DOUBLE PRIMROSES.

THERE is something singularly attractive in the double forms of the English Primrose, and they possess an almost indescribable charm redolent of the old-time florists and of the old English cottage gardens. Unfortunately, several of these delightful double Primroses are now exceedingly rare, some, possibly, entirely lost to cultivation, and others lead but a precarious existence. This languishing of an old favourite is to be deplored, and anyone who may assiduously collect and enthusiastically cultivate these lovely and wholly English plants, would, I feel sure, be conferring a lasting boon to gardens and gardeners; some few trade lists still contain an attenuated selection of double Primroses, and for others the enthusiast could not do better than to search the cottage gardens of old-world villages. As I write, I can visualise from memory just such a cottage garden tucked away in a Cotswold village, the air laden with the perfume of Sweet Rockets, and in spring the narrow path bordered with Auriculas (Bajers, a corruption of bear's ears), and Primroses, followed by Pinks and Sweet Williams. The double white Primrose is of fairly frequent

occurrence and is a chaste and lovely flower; it grows freely and increases fast, qualities which are lacking in some of its congeners, except where they grow in the humid atmosphere so thoroughly enjoyed by them. The double Lilac form (*lilacina plena*) is also fairly plentiful and is an exact counterpart of the white form in all except colour.

Collections of the remaining varieties are few and far between, and of them the cream are *Mme. Pompadour*, velvety crimson and very double; *Cloth of Gold*, double sulphur; *Amaranthina*, purplish-red; the old double violet and the ancient Tortoiseshell.

I have heard of good collections in Ireland, and I believe that the climatic conditions of that island are conducive to amazing vigour in the *Primula* tribe.

The double Primroses should be planted in a half-shaded situation, in deep soil rich in humus. It is essential to resort to division of the clumps at frequent intervals, for neglect to do so quickly leads to poor foliage, attenuated blooms, and eventually to the loss of the plants. *K. C.*

## ALPINE GARDEN.

## ASPERULA ARCADIENSIS.

*ASPERULA arcadiensis* (syns. *A. athoa* and *A. suberosa*) belongs to the popular Woodruff family, and it is quite the most beautiful of all the *Asperulas*. A profusion of coral-pink flowers crowns the woolly growths that are about three inches high. This plant is most suitable for pot culture, and grown thus forms a decorative subject of great attraction, especially as it lasts a long time in bloom. The specimen illustrated (Fig. 27) is growing in a pan eight inches wide and five inches deep, and is housed in a cold greenhouse through the winter months. *Mark Mills.*

## ADONIS AMURENSIS.

*ADONIS amurensis* generally flowers with me early in February, but is earlier or later according to the weather. It appears quite invulnerable and, although it may be found prostrate in hard frost, soon assumes its erect

FIG. 27.—ASPERULA ARCADIENSIS.

## CACHRYS LAEVIGATA.

I was once in the neighbourhood of the old castle of Gordon, above Grasse, amazed by the big tufts of a golden-flowering Umbellifer with very thin foliage and stately growth. The plant exhaled a strong and pleasant odour similar to that of the best incense, and this arrested my attention. "What can it be?" was my first question. Some days afterwards, I met a botanist friend at Aix-en-Provence, who told me it was the rare *Cachrys laevigata*, a plant of Spain and Portugal, which is sometimes found in Provence.

I took some seeds home, and have now, in the driest place of *Floraire*, a plant that has given its large panicles of yellow flowers throughout the summer and up to the end of September. The seeds exhale a resinous odour, and the whole plant is an acquisition to gardens. It needs only a deep poor soil, a very sunny exposure, and some room for its upward development. *Henry Corroon, Geneva.*

[*Hippomarathrum cristatum* is sometimes known as *Cachrys laevigata*, but is distinct. —Eds.]

posture when a mild spell returns. But such an early flower ought to have a sheltered situation, and I have found a dryish one, with some shelter from deciduous shrubs, helpful in hastening the bloom of this *Adonis* and prolonging its beauty. In my garden, it sends up stems a foot high bearing elegant, finely-cut foliage, surmounted by good-sized golden flowers. In some gardens the plant is dwarfier; its normal height is given by some as nine inches. There is a double variety with golden blooms, with a small centre of greenish colour. Several other varieties exist.

## SEDUM CAERULEUM.

No one who has ever cultivated the little *Sedum caeruleum* in the rock garden or very front of the border, will venture to assert that this tiny subject is not worth growing, although it is better suited to the rock garden than the border. In the former, it is admirable for sowing, or planting out where small early bulbs have flowered and finished their course. These frequently leave bare spots which it is desirable to cover with some late-flowering carpeting

plant which will not harm the bulbs beneath, and which, in themselves, will be attractive features. *Sedum caeruleum*, a half-hardy annual, will meet the desired conditions. It may be sown under glass in March or April, or in the open or in pots in May. It thrives well if sown where it is to bloom, if the plants resulting from the seeds are well thinned. In autumn the little carpet will be spangled with small, delicately beautiful, light blue flowers, the whole plant being from half-an-inch to three-quarters-of-an-inch in height.

#### SPIRAEA BULLATA.

Of the many shrubby species of *Spiraea*, *S. bullata* (syn. *crispifolia*) is one of the best for the rock garden, as it is a very slow-growing, dwarf species; a plant in my old garden had, in the course of about twenty years, only attained a height of about two feet. It was grown in rather hard, poor soil to keep it dwarf, but it showed no tendency to surpass the normal height of two feet, which it commonly attains.

This species flowers well and gives numerous flat heads of crimson flowers. It is quite hardy and withstands the most severe winters. Plants may be procured and planted in early spring, and, when they can be obtained in pots, at any time throughout the year, if turned carefully out of the pots and the ball of soil and roots kept intact. *S. Arnott*.

#### SCORPIURUS SULCATA.

The genus *Scorpiurus* comprises some half-dozen annual plants of neat tufted habit, growing in sandy districts bordering the Mediterranean, both in Europe and Africa. *S. sulcata* (Fig. 28) is the most desirable of them all from a horticultural point of view. It is found in sandy fields in Italy and Spain. In cultivation it forms a neat, spreading tuft of leafage on stems radiating from the central root-stock, which is furnished with a long tap-root.

The leaves are alternate, broadly oblong, blunt, or slightly pointed, tapering to a narrow petiole which clasps the stem. The leaf is rather thick and fleshy; its surface is smooth and glossy and of a bright green colour. The stem is somewhat paler in colour and has red stripes just above where it is clasped by the leaf, which add to the plant's decorative value.

The flower stems are gracefully curved and rise from the axils of the leaves on the ends of the branches; they are from three inches to four inches long, very slender, and bear twin flowers on short pedicels. They are of the usual Pea-flower type, and are about half-an-inch in length, with a large, spreading standard and rounded keel; in colour they are golden yellow with a few brownish streaks at the base of the standard and are sufficiently numerous to make a display. The seed pod is very curious, and the plant is worth growing for this alone; it resembles a pale green caterpillar covered with four rows of tubercles and curled like a watch spring; it is nearly an inch in diameter. The blossoms open in the months of May and June in its native habitats.

In cultivation *S. sulcata* will thrive in any well-drained light soil, where it is fully exposed to the sun; the seeds may be sown in the rock garden or border and the seedlings thinned to about one-and-a-half feet apart. *A. W. D.*

#### ANEMONES OF THE HEPATICA SECTION.

Few flowering plants are more highly appreciated during spring than *Anemone Hepatica* (syn. *Hepatica triloba*). Forms with blue, white and red flowers are frequently met with in cottage gardens, thriving luxuriantly in bold masses in partially shaded nooks and other places, and it is hardly possible to conceive anything more beautiful than well established specimens. The ground should be dug deeply as the plant sends its roots down deeply. Hepaticas are admirable subjects for planting in the north or east end of the rockery; arranged in groups of one colour they produce an abundance of bright flowers during the spring and early summer.

The larger and more showy Hepaticas are varieties of *Anemone* (syn. *Hepatica*) *angulosa*,

and have distinct, downy, scalloped foliage and large flowers. The type is suitable for massing and has rich clear blue flowers.

*A. angulosa alba* is equally effective with white flowers, also the variety *rosea*.

The following double-flowering Hepaticas are extremely pretty, having large, double flowers:—*triloba alba plena*, white; *triloba caerulea plena*, clear blue; *triloba rubra plena*, red. These make charming pot plants for the alpine house.

The plants are propagated by division or from seeds, which should be sown so soon as they are ripe. Hepaticas are impatient of too frequent division. *W. L.*

#### CYCLAMEN ROHLFSIANUM.

In his monograph of the genus *Cyclamen*, Hildebrand describes, p. 84 and table VI, a North-east African *Cyclamen* which had been already published under the name *C. rohlfsianum* in the *Bulletin de l'Herbier Boissier* (Geneva, 1897). It was brought from the Cyrenaean desert by Mr. Barbey-Boissier, and grew in his garden at Valleyres, without having ever flowered. Nobody elsewhere, but Dr. Ragionieri, in his garden at Firenze, could ever flower the plant. We have had it here for twelve years and it seems to prosper, but I have never seen it bloom. But, in Firenze, Dr. Ragionieri seems to be able to grow it easily, although he keeps it in a glass-house. He gave me specimens, and I hope to bring them into flower.

Some of the tubers are very large; one measured fifteen centimetres in diameter and weighed more than one pound! According to a letter received from Padre Zanoni, in Benghazi, who sent me my first tubers, the plant grows in deep crevices between the stones of broad walls that surround the gardens ("dolines") of an oasis, called Giok or Girk. These walls are deeply cracked, sometimes fifteen feet to twenty feet deep, and in these crevices the plants are sheltered from strong winds as well as from brilliant sunshine. In the early spring they flower abundantly, and the native boys and women gather the beautiful, sweetly-scented blossoms and bring them into the market of Benghazi.

From the end of March to December the leaves are dry and nothing is seen of the plants. In the winter the tubers begin to send up large, broad leaves, deeply incised, and different in form from those of other *Cyclamens* by their irregular and big teeth; the young leaves are deep green, but when older they become characteristically spotted all over the surface. The flowers are large, deep carmine, very sweet-smelling, and have the stamens exerted as are those of *Dodecatheon* (this is, I believe, unique among species of *Cyclamen*). Later I hope to report whether my plants flower at Floire this winter. *Henry Correvon, Geneva.*

#### BOG GARDEN.

##### PRIMULA ROSEA.

This very beautiful *Primula* grows and flowers well in peaty soil on the banks of a stream or lake. The sturdy stems, from four to six inches in height, have from six to a dozen clear rose-pink flowers, each with a small yellow eye; the bright flowers are in refreshing contrast to the bright green foliage.

The leaves are from three to six inches in length, not unlike those of our native *Primrose*, but not crinkled, and only very slightly serrated at the edges; they are almost procumbent. The prominent "resting bud" during the dormant season is quite attractive in its red colouring.

The variety *superba* is larger in all its parts and, perhaps, a little more intensely coloured. This very fine species was introduced from Kashmir in 1879, and is figured in *Bot. Mag.*, 6437. *Ralph E. Arnold.*

## FLORISTS' FLOWERS.

### CHRYSANTHEMUMS.

As a competitive flower, it can hardly be said of the past season that the *Chrysanthemum* drew so many to the show arena as of old, but those who did take part in the prize winning were as keen as ever. No doubt the reason of a comparatively small number of competitors in these days is the altered circumstances of gardens generally, whereby fewer assistants are engaged than in days gone by. The growing of exhibition *Chrysanthemums* calls for much labour, and therefore it may have to suffer when labour is curtailed.

The "blue riband" of *Chrysanthemum* shows is probably the prize for a dozen vases of Japanese blooms at the National *Chrysanthemum* Society's exhibition in London. This class usually provides a display well worth recording. The first prize this season was won by one of the veterans of the cult, Mr. Charles Beckett. I think it is true that he had not visited a *Chrysanthemum* exhibition for over a dozen years, much less won a prize at one, and yet he came up with new life, as it were, and presented blooms of superlative merit. These were not wanting in size—which, by the way, is a quality thought by far too many as the most important, but they were specially notable for good finish and freshness; two points that come from intelligent cultivation. The hand of a master never forgets its cunning in gardening matters.

With thoughts for the moment on the large Japanese blooms, I may, in passing, name some of the novelties of the year which appealed especially to me. *Aloma* is one of those close, incurving flowers, in yellow, which may be a trifle small from a show point of view, yet it is most effective and choice. *Aquitania* has blooms of chestnut colour and is ball-shaped, as its lengthy florets recurve. I like it because of its refined appearance. *Scythia*, too, is a rounded bloom, but in this case the florets intermingle, showing an amber surface as well as a more yellow reverse. This is a pretty variety. *Yellow Majestic* need only be named. Possibly we shall see examples more shapely if less large than those noted already, for the variety is bound to be popular. This sport, by the way, cropped up in several places last autumn.

Single-flowered varieties come next in importance, and these did not impress me generally, and at the early shows particularly. It may be the first week of November does not find many sorts at their best; still, my impression is the method of cultivation adopted is often at fault. Topping the leading stems at any time has not assisted the writer, but rather the reverse in so doing; too much valuable time in the plant's growth is lost. The practice is to stop the plant twice in order to get a suitable number of branches; this, of course, in the younger stages, yet it not only retards the flower buds, but results in too many blossoms opening with an undesirable number of florets. The flowers, therefore, require to be pulled—that is, have some of the florets removed, and thus they lose in character. A single variety never opens so true in form as it does from a natural growth, thinned for show blooms, obviously. We thus not only obtain the perfect flower but get the smaller foliage at the top as well. A single *Chrysanthemum* with big leaves loses much in grace.

At two meetings, the Floral Committee of the National *Chrysanthemum* Society, subsequent to its great show, dealt with quite half-a-dozen varieties, so fine, indeed, that there would be some difficulty in matching them from the great number of what may be termed established sorts. *Dorothy Capp* has white blooms; *Golden Seal* is a rich, deep yellow; *Grenadier*, almost scarlet; *Guardsman*, maroon; *Rita*, rosy-red on yellow; and *Crimson Dawn*, crimson with a conspicuous ring of lighter shade in the centre. Specimens of this variety were six inches across, or near to it, and they had perfect shape in addition to great substance. The above list does not exhaust the choice singles of the year, but is sufficient for illustration.

Incurved *Chrysanthemums* scarcely count in these times for competitive purposes, but the better of them are still in evidence as market

Carters Exhibit, awarded the Dundee Horticultural Society's Gold Medal and the Royal Horticultural Society's Gold Medal, Dundee, August, 1926.

RAYNES PARK, LONDON, S.W. 20

# Boulton & Paul *for* Modern Glasshouses

**B**oulton & Paul Conservatories and Greenhouses can be seen all over the British Isles, and after very many years' wear they still bear that mark of quality, design and craftsmanship associated with all their products. Let Boulton & Paul undertake your Horticultural Work, and you will be sure of right design and workmanship.

The service of an expert staff of designers is always at the disposal of clients, and we are ready to advise on any subject given. A representative will be sent by appointment to consult and prepare schemes for any kind of Horticultural work.

Ask for our free Catalogue No. 752.

## No. H 75. MELON and CUCUMBER FRAME

### Cash Prices:

- 1-Light Frame, 4ft. long by 6ft. wide ... £3 10 0
- 2-Light Frame, 8ft. long by 6ft. wide ... £5 13 0
- 3-Light Frame, 12ft. long by 6ft. wide ... £7 15 0

Carriage paid to most stations in England and Wales.  
 Packing extra but allowed for if returned.

Other Designs and sizes from 35/-. Ask for Catalogue No. 754.

Examples of B & P. Garden Frames, Greenhouses, Motor Houses, Shelters, Poultry Houses and Kennels may be seen at our London Office and Showroom.

## Fine Specimen Trees with excellent roots

**ABIES DOUGLASII** (Douglas Fir).  
 3 ft. to 4 ft. 12/- doz., 90/- 100; 4 ft. to 5 ft. 18/- doz., 140/- 100; 5 ft. to 6 ft. 24/- doz., 180/- 100; 6 ft. to 7 ft. 30/- doz.; 7 ft. to 8 ft. 36/- doz.

**PINUS SYLVESTRIS** (Scotch Pine).  
 3 ft. to 4 ft. 24/- per dozen, 180/- 100;  
 4 ft. to 4½ ft. 30/-; 4½ ft. to 5 ft. 36/-;  
 5 ft. to 6 ft. 50/- to 60/- per dozen

**PINUS AUSTRIACA** (Austrian Pine).  
 1 ft. to 1½ ft. 12/-; 1½ ft. to 2 ft. 18/-;  
 2 ft. to 2½ ft. 24/- per dozen

**PINUS LARICIO** (Corsican Pine).  
 1 ft. to 1½ ft. 9/-; 1½ ft. to 2 ft. 12/-;  
 2 ft. to 2½ ft. 15/-; 2½ ft. to 3 ft. 24/-;  
 3 ft. to 3½ ft. 30/- per dozen

**CUPRESSUS MACROCARPA**.  
 Grown in very exposed position, splendid plants, lifting with grand roots; much superior to pot-grown trees.  
 3 ft. to 4 ft. 30/- dozen, 230/- 100.

**T. SMITH, Daisy Hill Nursery, NEWRY.**

Largest Manufacturers of Flower Pots in the World.

## THE BEST AND CHEAPEST.

**SPECIAL POTS** for Roses, Vines, Clematis, Orchids, and Chrysanthemums.

Fancy Fern Pans and Bulb Bowls, from 3d. each.

No Waiting!  
 All Orders executed the same day as received.

State quantity of each size required and have Carriage Paid quotation, or write for Illustrated Price List.

Established over a century).

blooms. It is this latter aspect that gives the greatest hope for the future in respect to the whole subject. The British Florists' Federation during the autumn, gave the public some idea of what is being done by commercial growers in the fine exhibit at the Royal Horticultural Society's show on November 16. The blossoms, mostly of medium size, were splendidly grown, with not a floret out of place, and timed in freshness to the minute. The past season has been somewhat unkind to market growers. Some have complained of a glut, and, in consequence, indifferent returns. This is so each year, and probably most concerns those growers who do not send regularly and also those whose consignments are not of first-rate quality. So far as my observation goes, the centres are glutted, and home towns neglected. Anyhow, I have been surprised at the prices asked for very poor blossoms in places not thirty miles from London.

Varieties like *Atalanta*, mauve; *Enton Sun*, rich sparkling apricot; *Ruddigore*, bronzy-red; and last, but not least, *Yellow Favourite*—a form of a most popular late-flowering type; are, among others, useful additions.

Of early out-door *Chrysanthemums* no outstanding new sorts have been forthcoming, although the rich yellow *Madeline* may prove a really valuable sort when tried. I hear of several sports of note, but as these have not come before the public, it is well to wait before writing more about them.

Out-door *Chrysanthemums* have great interest to the trade grower in particular, and the future looks bright for this section. These varieties may be grown with a minimum of labour and the flowers are available when blossoms of many other plants are waning. It would appear that this type of *Chrysanthemum* is not popular as an exhibition flower, for in 1926 an exhibition offering prizes for them did not entice a single entry. H. S.

#### PERPETUAL CARNATIONS AND THE FUEL SHORTAGE.

Few varieties of the perpetual-flowering *Carnation* will open their blossoms satisfactorily in a lower temperature than 50°, and in most gardens the present fuel shortage has made the maintenance of that amount of warmth an impossibility, with a consequent shortage of bloom. Certain varieties, however, do succeed in cooler conditions and are well worth noting. In a collection of about twenty varieties, the outstanding sort is *Topsy*, which, although the temperature of the house has dropped to 35° and been in the neighbourhood of 40° for some time, continues to open its blossoms to perfection: *Rose-pink Enchantress*, *White Wonder* and *Mikado* also open well. *Laddie* and *Carola* open very slowly, with a split calyx. Varieties that appear to be at a standstill are *Baroness de Brien*, *Eileen Low*, *Saffron*, *Peerless* and *Triumph*. Other varieties, including *Delice*, show colour, but do not develop their petals satisfactorily in so low a temperature. The plants, however, remain in perfect health, and one can anticipate an extra flush of bloom as the days lengthen, owing to the retarding effect of a more natural wintering.

No doubt other gardeners with a larger collection could give the behaviour of other varieties in a low temperature, and a useful list could be obtained. The ideal position for plants when fuel is scarce seems to be near a lime-washed back wall of a well-lighted, lean-to house. In such a position they receive the maximum amount of warmth with proportionate light, air and freedom from damp.

Open stages in winter are to be preferred to those covered with ashes or shingle, a freer circulation of air being maintained, whilst a dusting of fresh lime on the floor will keep the atmosphere sweet and healthy.

Blossoms that are tardy in opening may be picked when half-developed and placed in water in a warmer house or the dwelling house, when most varieties will open to perfection, the scent also being improved.

During a period of low temperature the water-pot is hardly needed for days, in fact a few plants here were not watered, inadvertently, for a month, and although quite dry, they remained healthy. R. Gardner, Heywood Gardens, Cobham, Surrey.

### THE RIGHT OF LIGHT.

THE right of light is probably one of the most valuable rights over land which the English law recognises. It is to this right that notice boards with the words "Ancient Lights" on them refer to, and it is to preserve this right that property owners put up a wooden screen so soon as an adjoining owner erects a house with windows overlooking his neighbour's vacant land. The right of light or the easement of light, as it should be called, is a right which the owner of property may acquire, to have a flow of light coming to his premises, and to prevent the owner or occupier of the adjoining land from putting up any building or doing anything else which will obscure such light. From this it will be seen that not only is it

to enjoy? It used to be thought that when once such a right had been acquired the owner was entitled to the same amount as existed at the time of the acquisition of the right, but it has since been decided that the right is only to a reasonable amount of light, and unless the owner of the premises can show that there has been a substantial interference with the comfortable use and enjoyment of the building the fact that he has been deprived of some part of the light which he formerly enjoyed does not entitle him to bring an action. Nor has he any power to increase the burden cast upon the adjoining owner by opening more windows and so claiming more light in respect of them, than he formerly enjoyed. On the other hand, however, if the room which the windows used to light has been out of use during some of the period during which the right was being acquired

FIG. 28.—SCORPIURUS SULCATA.

(see p. 48.)

a very useful right to acquire, but if such a right is allowed to be acquired against an owner of property, that property will greatly depreciate in value. The questions which arise then are by whom and against whom can this right be acquired and what is the method of its acquisition.

In the first place the easement of light can only be taken advantage of by the owner or occupier of land on which stands a building with windows opening on to someone else's property; thus the owner of a vacant piece of land can never claim or acquire the easement of light. The usual method of acquiring the easement is by what is known as prescription or long and uninterrupted usage, although it may also be exercised under a special grant from the owner of the land over which it exists. By the Prescription Act, 1832, it is enacted that when the access of light to any house or building has been actually enjoyed for a full period of twenty years without interruption, the right to it is absolute, unless it was enjoyed by some agreement in writing. Twenty years then is the period during which the right must be exercised before any action can be begun to prevent the adjoining owners or occupiers from interfering with it.

When a man has acquired a right of light, to what amount of light does this entitle him

this will not destroy the right, although if the windows have been shut up this will amount to non-user, and the time during which they are closed cannot be counted.

If a right of light is being interfered with, the person who is entitled to the enjoyment of the right can claim damages for any loss the interference has caused him, and also an injunction preventing any future interference Harold Sharman.

### WILD GARDEN.

#### EPIGAEA REPENS.

THIS is a North American plant, known popularly as *Mayflower*, and belonging to the *Ericaceae*. It forms a small, trailing, evergreen with delightfully fragrant, rose-tinted flowers, which are borne in small clusters during late spring and early summer. It was introduced in 1736, but is by no means common in gardens. Its natural habitat is under Pine trees, therefore such a position should be selected for it in the garden. The rooting-medium should consist of sandy peat.

This *Epigaea* transplants with difficulty, unless it is established in pots. It makes an ideal and interesting subject for the wild garden. F. W. G.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

**T**HE Bay Islands are situated in the Bay of Honduras, that is, the part of the Caribbean Sea stretching from Yucatan to the Republic of Honduras. They extend nearly parallel with the mainland, from which the distance varies from ten to forty miles. Geologically, they are a prolongation of Cape Salsipuedes (Punta Sal) by Tela, and of the high Omoa range which runs between the Motagua and Chamelecon rivers.

The area of the whole archipelago, which forms the Honduran department of "Islas de la Bahía," is about 775 sq. km. (300 sq. miles), and the population numbers about 6,000. The names of these islands, from west to east, are: Utila (Utila), Ruatan (Roatan), Helen (Eléna), Murat (Morat), Borburata (Barbareta), and Bonacca (Guánaja), while south of Ruatan and much closer to the mainland are situated the two small Hog Islands (Cayos Cochinos).

The islands are surrounded by numerous keys and coral reefs, and they are apparently of volcanic origin. Ranges of low hills traverse the same, and isolated peaks reach in Bonacca an elevation of over 365 metres (1,200 feet) above sea-level, while in Utila the highest hill does not even reach one hundred metres (300 feet). From these ranges small streams or gullies descend to the sea, but on Utila and Murat islands the inhabitants are entirely dependent upon rain and well-water.

Limestone is the principal formation of the Bay Islands. The lower parts consist of coral, and, geologically speaking, they have been raised above the level of the sea in recent times. Many of the coral reefs, which surround the islands and keys, are still in the process of formation. The shore of the Bay Islands consists largely of ragged limestone which renders it very difficult to walk along by the sea. Such places are locally called Iron Shore, or Iron-bound Shore, from the amount of iron contained in this limestone. Slate is met with on the more elevated islands of Ruatan, Bonacca, Borburata and the Hog Islands. Quartz, granite and sandstone are also found. The climate is agreeable, inasmuch as cool sea breezes blow almost constantly. The average temperature is from 80° to 85°, and very seldom

does the thermometer register 100°; during January or February nights it may occasionally fall so low as 60° or 65°. There is hardly any disease met with at the Bay Islands, except for light cases of malaria at the changes of the seasons.

The winter or rainy season sets in during October and comes to an end with the beginning of March. The remainder of the year is known as the summer, or dry season, but only the months of April and May are entirely free from rain. During June and July light showers are rather frequent, and occasionally such is the case in August and September. The wettest and most disagreeable months of the year are November, December and January.

The inhabitants of the Bay Islands have nearly all descended from those of the island of Grand Cayman (a dependency of Jamaica), the number of immigrants from England, Scotland, the United States, Germany and other countries being comparatively insignificant. A small number of "Spaniards," as the Ladinos or Honduraneans of Spanish speech are called by the Bay Islanders, have arrived from the mainland. On Ruatan Island there is also a settlement of Black Caribs (a mixture of Carib Indians with Africans) who in 1796 were deported by the British Government from their original home, St. Vincent (one of the Windward Islands), and put ashore at the Bay Islands. Negroes and Mulattoes form the bulk of the population; nevertheless, white people predominate in Utila, Bonacca, and in several smaller settlements on Ruatan.

English is the predominating language, and in spite of the fact that these islands have belonged to Honduras since 1861, many of the older people do not understand Castilian. The Caribs have a language of their own, but many of them know English and Spanish also. The Bay Islanders talk English with a slow drawl, putting the stress generally on the last syllable. A few of the local English names have been borrowed from the vocabulary of the Mosquito or Miskito Indians who inhabit part of the eastern shore of Honduras and Nicaragua. Settlements from the English of Jamaica on this so-called Mosquito coast, date back several centuries, and Miskito words were adapted by the colonists to designate the names of plants and animals not met by them in the West Indies. The local English names are, therefore, with a few exceptions, the same as those used in British Honduras, and among the Creoles of the Mosquito Coast.

The local Spanish names are, of course, identical with those used on the neighbouring Atlantic coast of Honduras, which often differ from those met with in the interior and on the Pacific slope, and are more related to the vernacular names of Cuba.

This being the first attempt to study the flora of the Bay Islands, the writer cannot claim to present a complete list of the economic plants which are met with. There are certainly to be found in the bush many minor trees and shrubs, utilised in some way or other by the primitive native population, which have escaped his observations. It is believed, however, that this paper, incomplete though it may be, will be found of use both to visitors and to residents of the islands.

Descriptions of plants found on the neighbouring mainland of Honduras are scattered through a vast number of publications, but most of this literature is unreliable and out-of-date on account of the uncertainty attaching to the names used by the earlier writers. Honduras has not attracted the attention of foreign naturalists to such an extent as other parts of Central America, and the local prosecution of study has received very little encouragement. Our knowledge of the flora of this Republic is, therefore, still in a fragmentary condition.

Agriculture (fruit raising) is the chief source of income of the Bay Islands, but the ground is practically untilled, and there is not a single plough in the whole department. Some of the most important cultivated plants, as Bananas, Plantains, Coconut Palms, Yams and Sugar Cane are of old-world origin. Maize or Indian Corn (*Zea Mays*, L.), which ranks as a staple food in the larger part of Spanish America,

is not much cultivated by the Caribs or by the English-speaking Bay Islanders. Of the different species of Beans, by far the most common one is the Red Bean, a form of *Phaseolus vulgaris*, L., which is somewhat smaller than the Kidney Bean of the United States. American Kidney Beans are also imported.

With the natives of the Bay Islands, including the Caribs, Cassava, Yams, Coconuts, Bananas and Plantains are the staple food subjects. Bananas and Coconuts furnish also the great bulk of the export trade. Rice (*Oryza sativa*), a native of Asia, and said to be found growing wild in South America, is occasionally cultivated in ordinary fields, without irrigation. Practically all the Rice for local consumption is imported from the East Indies and the United States by way of the American Gulf ports. The Bay Islanders cook it in Coconut milk.

Sugar Cane (*Saccharum officinarum*, L.), which was introduced by Hernán Cortés, the conquistador of Mexico, in 1528, from Haiti into Trujillo, is the source of crude sugar and syrup made with the aid of the most primitive machinery. Of late, the cultivation of this plant has diminished considerably, the better class natives using exclusively imported, refined sugar. The juice is also taken as a beverage after being left to ferment, and there is also a little rum distilled clandestinely.

Some of the important economic plants of the neighbouring mainland of Central America are entirely absent in the Bay Islands, except perhaps a few specimens planted in gardens as ornaments or for experimental purposes. Such plants are not listed in this article, as they cannot be included among the economic plants of the Bay Islands. This, for instance, applies to Cotton (*Gossypium* sp.), Tobacco or Tabaco (*Nicotiana Tabacum*, L.), the Castor Oil Plant or Higuierillo (*Ricinus communis*, L.), the Rubber Tree or Hule (*Castilla* sp.), Coffee (*Coffea* sp.), Cacao (*Theobroma Cacao*, L.), etc.

For convenience, the plants described have been divided into four classes, namely, fruits, vegetables, Palms and miscellaneous economic subjects. In each case the scientific name is followed by the local English and Spanish names, and a few notes are added with regard to the native method of cultivation, local uses, etc. An attempt has been made in each division to mention them in the order of their importance, but this has not been rigorously adhered to.

## BANANAS AND PLANTAINS.

The Banana or Guineo (*Musa* sp.) was apparently not found in America in pre-Columbian days; it is not mentioned by any of the early explorers, conquerors and historians of the new World. During the early colonial days it was taken from the Canary Islands to Haiti, and then soon made its way into the remainder of the American tropics. This fruit takes second place among the exports of the Bay Islands; it is shipped to the Gulf ports of Florida in local schooners, a voyage of only three to four days. The first Central American Bananas appearing on the North American market were sent from Utila Island about 1870. For some time afterwards they made up the bulk of the export trade, and enormous profits were obtained by the natives, but, later, the market was supplied by the mainland of Honduras and other countries around the Caribbean Sea, and the Bay Islanders found it more profitable to raise Coconuts. In these islands practically every one plants some Bananas to sell, but on the mainland the whole trade is in the hands of a few North American companies who have their own plantations, railroads, loading facilities, steamers, etc.

The Banana requires a deep soil, a high temperature, and a great deal of moisture; it rarely produces seeds, and these are generally useless for propagation. New plants are started from the head or rhizome, which is dug up with the machete (a very large, heavy knife) and cut up in several parts, taking care that each one of these divisions, or "bits" as they are called, has at least one eye. Such a bit, which weighs about three to four pounds, is put in a hole in the ground about six inches below the surface and then covered up. Within

ten to twenty months the plant will bear mature fruit. Each "tree" bears only one bunch of Bananas; in order to harvest them the whole stem is cut down and one of the surrounding suckers will take its place. Including the large leaves, the plants will reach a height, varying according to the variety, from ten feet to thirty feet. No fertiliser is used and very little tilling is done, except the occasional cutting down of the bush or grass with the aid of a machete. On account of their perishable condition the utmost care has to be taken in handling the fruits, which for export must be cut a little before maturity. The average bunch of the common variety weighs from 50lb to 75lb (25 to 35 kg.). Each bunch is made up of layers or "hands," as they are termed; and each hand contains a number of individual fruits or "fingers." Bunches of fewer than seven hands are rarely accepted for shipment.

## TREES AND SHRUBS.

### EUCRYPHIA PINNATIFOLIA.

For late summer effect in the garden few subjects can compare with this beautiful shrub, which, though often described and praised, is still comparatively rare.

A native of Chile, *Eucryphia pinnatifolia* was introduced in 1859, and is well illustrated in the *Bot. Mag.*, t. 7067. In warm districts it is semi-evergreen, but for practical purposes may be regarded as deciduous. Rather slow and upright in growth, it finally forms a compact bush or small tree from ten feet to twenty feet high.

The rich, glossy-green leaves are produced oppositely near the ends of the shoots and are,

### CORONILLA GLAUCA OUT-OF-DOORS.

Of the various *Coronillas* in cultivation, the subject of this note is one of the freest in flowering. It is rarely out of bloom, and in December some bushes, three to four feet high and as much through, in these gardens, were making a fine display with numerous rich yellow flowers. Bright colour in the garden is especially welcome in winter, and for this reason the plant is worthy of a trial in the open, although it is on the tender side; a sheltered spot could be found in many gardens where the district is colder than the neighbourhood of Chepstow.

At Castleford, the plant is quite successful in the open in average winters, but in 1916-1917 the cold was too severe and the plants were killed. Since then, however, it has been growing freely outside, and during very severe

FIG. 29.—EUCRYPHIA PINNATIFOLIA.

Locally, the Bananas are consumed in many different ways; when still green they are boiled and eaten as a vegetable. Ripe Bananas are baked, fried, made into jelly, vinegar, etc.; Banana figs or Banana chips are the sun-dried slices of the mature fruit. A flour, of a yellow colour, is made from the green, full-grown fruit, which, cooked with milk, is a good food for infants and invalids; mixed with wheat flour it is also used to make bread. On account of its nutritive and digestive qualities great stress is laid by some on the future importance of the Banana as part of the food supply of the populations of the temperate zone, but it must be remembered that the Banana consists largely of water and that its protein content and its nutrient value are very small as compared with our staple food stuffs. *Edouard Cossmann*, 33, Boulevard des Batignolles, Paris.

(To be continued.)

as the specific name implies, pinnate, consisting of three or five leaflets.

The flowers (Fig. 29) are produced either singly or in pairs, in terminal, leafy clusters, in such profusion on mature plants as to produce a very striking effect. Each flower is about two-and-a-half inches in diameter and consists of a large, prominent central cluster of golden-anthered stamens, surrounded by four white petals. No doubt the rareness of this shrub may be attributed to its slowness of growth and to the fact that it is a difficult plant to propagate. Layering is the general method adopted, while of recent years many of the older plants have produced an abundance of fertile seeds, thus providing a ready but rather slow means of increase. It seems to resent being disturbed, and should, therefore, be planted permanently when fairly young, in rich, peaty loam, in a warm, sheltered position. *A. G. F.*

weather is protected with a few evergreen boughs.

Such a bright and useful subject is well worthy of a little extra care and attention, for the glaucous foliage is an added charm, and is in pleasing contrast to the wealth of yellow flowers.

*Coronilla glauca* will succeed in almost any soil, but land of a gravelly nature is, perhaps, best suited to it. In such a rooting-medium the growth is not very vigorous, short-jointed and more woody, and for this reason more able to withstand a spell of cold weather.

The plant may be propagated from cuttings inserted during July and August; they will form roots readily in a cold frame.

*C. glauca* is an excellent winter-flowering plant for the cool greenhouse, and when the specimens become too large they may be transferred to suitable positions out-of-doors. *B.*

## ULTRA-VIOLET LIGHT AND HORTICULTURE.

In *Gard. Chron.*, November 27, 1926, an article appeared on the subject of ultra-violet rays of light and their potentialities in regard to plant culture. The whole question of light-therapy and treatment, whether for human beings, animals or plants, is now assuming such importance that it may be as well to correct some earlier impressions, and place before your readers exact information in regard to what modern scientific research has established, so that the results may be applied to the needs of horticulture.

Ultra-violet rays treatment depends for its results on the application of the short wave-lengths of invisible light that lie beyond the violet rays of the visible spectrum. In the light of the sun the visible violet ends at 3,900 wave-length of the Angstrom scale, but the invisible rays, becoming shorter and shorter, extend so far as 2,900 wave-length on a clear day. It has been established by the researches of scientists that it is the rays that lie between 3,100 and 2,900 wave-lengths that exert definite biological effect. Longer wave-lengths, up as far as the visible spectrum, have been shown to possess no curative value, and have, for example, no effect on rickets.

A spectrum in which the source of light is an open iron arc, shows very clearly the exact location of the *vital rays*, and shows further, that they are completely obstructed by ordinary glass, such as is used in greenhouses. Vita glass, to which reference was made in our earlier article, permits their passage to the extreme limits of the sun's spectrum.

Long years of research by such scientists as Rollier, Finsen, Gauvain and Leonard Hill, working with both natural and artificial light, have proved that these are the rays that promote growth, and prevent and cure weakness and disease. They exercise, moreover, a general tonic effect on the system, whether human or animal, where no specific disease exists, and are the cause of the pigmentation of the skin, and increase of bodily vigour, that are usually associated with sunburn after a sea-side holiday.

In regard to human beings and animals, these facts are universally accepted, and the new science of heliotherapy utilises them to the full with wonderful results. In horticulture, however, the knowledge gained has not yet been actively applied.

Several reasons exist to account for this, the most important being the lack of knowledge of plant physiology in relation to light-waves, coupled with the great expense, both in initial outlay and in maintenance, of artificial light apparatus, which, up to the present, has been the only means at disposal for irradiating plants with ultra-violet light, just as is done to rachitic and tuberculous children in "sun" clinics.

In regard to the action of ultra-violet rays on plants, information is mostly inferential. It is known that their physiology is analogous to that of animals and human beings, though it may function in other ways, and it may be reasonably assumed that light-waves that promote growth and eradicate weakness in one case will do so in other living organisms.

Inferences of this nature receive considerable corroboration from the results of plant culture in countries where the ultra-violet content of the atmosphere is known to be far higher than in Great Britain. In Canada, where the ultra-violet content of the north sky is about twice as high as at Hampstead on a clear day, a very short growing season produces bumper crops of Wheat. In Bangalore, on the Deccan plateau in India at about 3,000 feet above sea-level, and in Kulu and Chamba on the foothills of the Himalayas, the most extraordinarily rapid and gigantic growth of fruits and vegetables is obtained, despite primitive methods, and a temperature that is no higher—very often lower—than our own. These results can be attributed to nothing else but the high propor-

tion of ultra-violet light available at these altitudes.

Moreover, fruits and vegetables grown under glass are inferior in flavour to those produced under natural conditions where the climate permits. Hot-house Grapes seldom possess the same flavour as those that produce the "bottled sunshine" of France. Again, it is the action of ultra-violet light on the cholesterol in organic tissue that produces the essential vitamins, and hence vegetables grown under glass which obstructs the passage of these rays, remain devoid of the very qualities on which their food value depends. It has further been shown that the absorption of the "actinic" or short wave-lengths of light, which, of course, include the ultra-violet, by the chlorophyll in plants, is responsible for their brilliancy and colour, both of bloom and foliage. It is possible that the action that takes place is akin to that which produces an erythema or irritation in the human skin when irradiated by ultra-violet light of short wave-length, and that the colour and brilliancy of blooms and foliage increase or wane according as the vital rays reach the plant or are obstructed. It seems obvious, following the analogy of human physiology, that the shorter the wave-length

## MESEMBRYANTHEMUM.

(Continued from p. 33).

**Conophytum Marlothii**, N. E. Br. (Fig. 30).—Plant as received about  $\frac{1}{2}$ -1 inch high, consisting of a few lax and rather distant forked stems, each ultimate branch 4-6 lines long, gradually increasing in diameter upwards and  $2\frac{1}{2}$ -3 lines in diameter at the top, densely clothed with somewhat smooth, closely imbricating sheaths, rather hard in texture, dark brown edged with whitish. Growths 3-4 lines long and 3-4 lines in diameter, obconic, circular or broadly elliptic at the nearly flat top (type F.), with a depressed orifice  $\frac{1}{2}$ -1 line long; surface smooth, glabrous, of a greyish glaucous-green, thinly sprinkled with separate dark green dots and the orifice surrounded by an elliptic dark green line or row of dots; when in active growth, if held at a proper angle to reflected light the dots (when viewed with a lens) are seen to be shining while the rest of the surface is opaque. Flowers not seen.

Little Namaqualand: Ugrabis Mountain, in the Richtersveld, Marloth 6941!

Of all the species sent to me by Dr. Marloth

Natural size, as imported. Photographed by M. Fr. de Laet.

of actinic light, the greater the effect produced, and this is borne out by the well-known characteristic brilliancy of alpine plants.

From these premises, the far-reaching possibilities of vita glass in greenhouses, in view of its unique property of transparency to the vital rays, becomes of very considerable interest to the horticulturist. Vita glass has a high percentage of quartz in its composition, and is therefore more expensive than the cheap glass that is usually utilised, but its greater tensile strength and thickness enables far larger sheets to be used, thus eliminating the cost of unnecessary frame-work. It is this last factor that accounts for by far the largest proportion of the total cost, and hence, at any rate for new construction, the total cost of vita glass should be little more, if at all, than its ordinary prototype.

The results that should, however, accrue—the eradication of weakness, acceleration of growth, increased warmth (owing to the additional percentage of heat rays that are also transmitted), and consequent economy in heating costs, and finer and richer blooms and fruits, should more than compensate for any additional outlay. Science has provided the means, and it may now be possible for horticulturists to defeat the restrictions imposed by our erratic climate, and our long and inclement winter. H.

that he collected during his expedition to the Richtersveld, in Little Namaqualand, this humble species appealed to me as being the most distinct in its general appearance; I have therefore much pleasure in dedicating it to his memory as a slight but grateful acknowledgment of the aid and information he has on many occasions given me during my work upon these plants. *C. Marlothii* differs from all known species by its laxly-forked stems clothed with hard, smooth, brown sheaths, very different in character from the brown, grey or white friable sheaths that are usually found on these plants, and by its small, flat-topped growths, sprinkled with dots that shine when held at a certain angle to the light, while the remainder of the surface is opaque.

To a certain extent the growths of *C. Marlothii* resemble those of *C. kubusanum*, but in the latter species they are smaller, of a darker green, more crowded, and not on lax stems, and have friable greyish sheaths, and the dots are more numerous.

For the illustration of this species I am indebted to the courtesy of Monsieur Fr. de Laet.

**C. Meyeri**, N. E. Br. (Fig. 31).—I am now able to illustrate this species from an excellent photograph sent to me by Monsieur Fr. de Laet.

**C. micellum**, N. E. Br.—Growths small, 4-5 lines high,  $2\frac{1}{2}$ -3 $\frac{1}{2}$  lines in diameter, obovoid,

Grow

Webb's

Delicious Marrowfat  
GARDEN PEAS

By cross-breeding and selection we have secured wonderful improvements in Garden Peas, and it is now possible, under suitable cultivation, to obtain a supply of delicious Marrowfat Peas for a period extending from early Summer to late Autumn.

Section of a row of WEBBS' SENATOR, the most remarkable cropping pea ever raised. Delicious flavour; wonderfully popular. Awarded Royal Horticultural Society's First Class Certificate.

A fine crop of WEBBS' STOURBRIDGE MARROW. One of the very best large-podded peas in cultivation. Enormous yielders, of excellent quality. Awarded hundreds of First Prizes at leading Horticultural Shows.

For Vegetables,  
Flowers, Plants, Fruit,  
Lawns and Vine  
Borders, use

elliptic or circular in outline viewed from above, convex at the top, with a slight notch at the orifice (type somewhat like E.), and a faint keel on each side of it; orifice  $\frac{1}{2}$ -line long; surface smooth, glabrous, green, with a darker line along the keel and another outlining the lips of the orifice, and a few separate dark dots irregularly scattered over the top, but all these markings are rather indistinct, yet in full sunshine the line on the keel would probably be purplish. Flowers unknown.

Little Namaqualand: Witklip Poort, near Ugrabis, in the Richtersveld, Marloth 6933!

This small species is but little larger than *C. saxetanum*, N. E. Br., which it somewhat resembles in general appearance. Described from a living plant sent to me by Dr. Marloth.

**C. Muiri**, N. E. Br.—Growths as received small, nearly as type E., 3-4 lines high and 2-4 lines in diameter, elliptic or nearly circular in outline and convexly flattened at the top, with a very slight notch at the centre and no trace of any ridge; orifice  $\frac{1}{2}$ -1 line long; surface smooth, glabrous, of a light glaucous-green or chalky-green colour, indistinctly marked with irregularly scattered dots of a slightly darker tint, usually separate, but on some growths here and there connected into lines and

across the top transverse to the orifice and 2-3 somewhat angular bumps on each side of it; orifice  $\frac{1}{2}$ -1 line long, closed; surface smooth, glabrous, light green, sometimes with, sometimes entirely without a few rather indistinct separate darker green dots sparingly scattered over the top, and the orifice sometimes is very indistinctly outlined with a darker green line parallel to it on each side, but more often this outline is absent. Flowers unknown. Clanwilliam Division: Near Klaver, Marloth 11899!

This species is distinguished from all others by the peculiar angular bumps upon the top of the growths. Described from a living plant received from Dr. Marloth.

**C. obscurum**, N. E. Br.—Growths 3-4 lines high, 2-3 lines in diameter the first year after importation; obconic, circular or elliptic in outline viewed from above, flattish on the top (type F., without the notch), with only the orifice itself depressed and no trace of a keel; orifice  $\frac{1}{2}$ -1 line long; surface smooth, but under a lens there sometimes appears to be a slight unevenness, glabrous, of a rather dark green sparingly marked with a few separate dots of darker green, but the orifice is not outlined with a darker colour in any way. Flowers not seen.

FIG. 31.—CONOPHYTUM MEYERI.

Natural size, as imported. Photographed by M. Fr. de Laet.

the orifice enclosed in an elliptic or diamond-shaped line of the same dark tint. Calyx-tube about  $\frac{1}{2}$ -line long and  $\frac{1}{2}$  line in diameter, 4-5 lobed; lobes  $\frac{1}{2}$  line long, ovate, reddish. Corolla-tube about as long as the calyx-tube; petals about 16, in 1-2 series,  $1\frac{1}{2}$ -1 line long and about  $\frac{1}{2}$  line broad, filiform-linear, obtuse, pale yellow. Stamens few, in two series, exserted from the corolla-tube. Style very short or almost absent. Stigmas 4, about  $\frac{1}{2}$  line long, filiform, erect, attaining to about the middle of the corolla tube.

Ladismith Division: Among stones and rocks on hillsides south of Touws Berg, Muir 883!

The small size, flattish tops and glaucous-green colour of the growths of this species as seen the first year after its importation readily distinguishes this plant from all others at present described. I am indebted to Dr. J. Muir for the living plants from which I describe, and am glad of the opportunity to associate his name with a member of this genus. I suspect, however, that after it has been in cultivation for awhile its size and, perhaps, appearance will have altered.

**C. novellum**, N. E. Br.—Growths as received 4-6 lines high, 4-5 lines broad and 4-4 $\frac{1}{2}$  lines thick, obconic, elliptic or nearly circular, and at the same time faintly angular in general outline viewed from above, somewhat truncate in side view, but having a distinct ridge

Little Namaqualand: Ugrabis Mountain, in the Richtersveld, Marloth 6938!

Described from a living plant received from Dr. Marloth. It is rather insignificant in appearance, but is quite distinct from all others known to me.

**C. picturatum**, N. E. Br.—Growths as received 3-4 lines high, 3-5 lines broad, and 2 $\frac{1}{2}$ -4 $\frac{1}{2}$  lines thick, shortly obconic elliptic or nearly circular in outline, and flat or convex at the top (type E or F); orifice  $\frac{1}{2}$ -1 line long, level with the general surface, not at all depressed; surface smooth, glabrous, purple on the sides, the top grey-green, prettily and rather copiously marked and the orifice outlined with dark green or purple, stout, irregular lines or chains of connected dots, which are more or less connected together in an irregular manner, but form no definite pattern. Flowers not seen.

Clanwilliam Division: Between Clanwilliam and Citrusdale, Miss Foote!

I have to thank Professor R. H. Compton for this very distinct species, which he informs me was discovered by Miss V. J. Foote, a former assistant in Kirstenbosch Botanic Garden.

It is one of the prettiest species known to me, and is easily recognised by the top of the growths being flat and covered with irregularly branched and connected rather thick lines of dark green or purple, according to exposure to sunshine. N. E. Brown.

(To be continued.)

## NOTICES OF BOOKS.

### A French Book on the Chrysanthemum.

THIS little brochure\*, written in a helpful and practical style by one of the foremost French Chrysanthemum growers—Monsieur J. Lochot—will doubtless find a welcome with many hundreds of amateurs and small market growers of that most popular flower, the Chrysanthemum. Without being very ambitious (at ten francs it could scarcely be what publishers call "sumptuous"), it covers the ground amply, the text being greatly assisted by a number of good diagrams, and some photographic reproductions which are not quite so good. The various stages of cultivation are fully described and reasons for and against the different methods commonly employed are adequately discussed. As regards the comparative merits, for pot culture, of cuttings taken from pot plants or from the open ground, the author favours the latter, as being hardier and easier to manage, especially in the case of rather tender varieties. As, in France, the great bulk of pot Chrysanthemums are disposed of for the festival of All Saints (the 1st of November), the great object of market cultivation is to have the plants nicely in flower at the end of October, and every operation is timed to produce this result.

The subject of pests and diseases is fully dealt with, and some useful diagrams are included in this section. We are glad to note that the author lays stress on the useful part played by wild birds in keeping down insect pests, and on the folly of taking too severe measures against sparrows, which frequently have the effect of destroying valuable bird-allies. A few hints on decorating, and a list of the best varieties, bring to an end this serviceable little volume, which reflects great credit on author and publishers alike.

### Blumen im Hause.

THIS volume of nearly three hundred pages† treats in an exhaustive manner of the subject of flower decoration in the house, and touches also on other matters which may be considered more or less cognate to the original theme. The author, Herr Willy Lange, is well-known in German horticultural circles as a writer of a number of books, alone and in collaboration. He is a nature-lover first and foremost; a technician of the first rank, and a successful garden-architect. All his conceptions of design are based on his passion for nature, and his influence on horticulture in Germany has, of late years, been considerable. *Blumen im Hause* is not merely a text book on flower decoration; in the twenty or so pages of notes in which the author, as it were, "lets himself go," he strays considerably outside the main purpose of the book, and discourses entertainingly on all sorts of subjects—the rococo in decoration, Japanese art, the pentagram in Nature, Mendelism and mutation, the nature of "style," and the anthropological concept of life. In the main portion of the work, however, the subject is closely adhered to, and the text is supplemented by a generous collection of photographic illustrations showing the use of flower decoration for every possible occasion. The author writes delightfully in one of his notes on the Japanese methods, and gives many charming drawings of Japanese flower decorations. These, however, have the unfortunate effect of making the photographs appear inferior and inartistic, especially such illustrations as Fig. 35, in which a plaid shawl forms part of a general effect in which Lilies and Roses are thickly massed together; Fig. 34, bowls of Narcissus bulbs with immensely long stems, like reeds, the tiny blooms at the top almost invisible; and 38, in which a Bamboo stem is shown, stuffed with Roses in a way which would tempt a Japanese floral artist to commit hara-kiri. More pleasing, because more unaffected, is a "gift-table" (Fig. 44) in typically

\**Le Chrysanthème*, par J. Lochot. Paris, Librairie Agricole de la Maison Rustique, 26, rue Jacob. Price 10 francs (for England, 12 francs).

†*Blumen im Hause*, von Willy Lange. Leipzig, Verlag von J. J. Weber, R.M. 18.00.

German fashion, in which a birthday candle-cake and a basket of eggs look comfortably at home with stiff bowls of Tulip bulbs and a Cactus plant, while festoons of green foliage round the edge of the white table cloth add a softening effect.

There is no doubt that books on the subject of flower decoration are needed, and it is a pity that so few people think it worth while to write on so important and so interesting a subject. Herr Lange's book will, without doubt, receive a warm welcome in Germany, where his work in the realm of garden-planning is already so well-known. It may be noted, however, that in spite of the influence of Lange and other nature-lovers, decoration in Germany still suffers from over elaboration; frequently half or a third of the flowers used would look better, because they could be more lightly and naturally arranged. Without slavishly trying to imitate Japanese and Chinese decorative designs (which would be unsuitable to the present European style of furnishing) much can be learnt from them, and most of all the fact that if each flower and leaf is made to yield its best effect, very little "massing" will be required. "Massing" is fatal to art in nearly all schemes of floral arrangement; but it is easy, and is therefore likely to persist.

The book is well-printed on art paper, strongly bound in covers of an appropriate moss-green colour, and contains a number of good coloured plates as well as black and white illustrations. The general appearance and get-up is attractive, and altogether, *Blumen im Hause* forms a notable addition to European garden literature.

## EMULSIFIED OILS FOR THE DESTRUCTION OF INSECT EGGS.

It has generally been assumed, at any rate, in this country, that any chemical which could be used on growing fruit trees, even in the dormant period, as a means for the destruction of insect eggs, at such a strength as to be effective, would have a very detrimental effect upon the tree itself. Experiments carried out on large scales during the past two or three seasons, however, have shown that this assumption is somewhat erroneous.

Lime-sulphur, caustic soda and caustic lime have been extensively used during recent years in the dormant period, but it is very much open to question whether any have really substantiated the claims originally put forward as regards actual egg destruction. Unquestionably they are excellent specifics for cleansing the trees by the destruction of Moss, Lichen, etc., which act as hibernating quarters for both pests and certain diseases.

Lime, when applied hot, and freshly slaked, and as thickly as it is possible to spray with, does appear to either retard or prevent the hatching out of certain eggs. But cases have been frequently observed where the young larvae have managed to extricate themselves from eggs apparently well-covered with a good layer. "Case-hardening," however, cannot be taken as direct chemical destruction of the eggs. Again, lime-sulphur solution, although certainly caustic in its action, only appears to leave a finely divided film deposit of sulphur, which is not likely to disintegrate the chitinous covering of which the outer shell of the egg is composed. In the case of caustic soda, the final deposit, after exposure to air, will be carbonate of soda, which is readily soluble in water, so that causticity will rapidly disappear. The strength at which caustic soda is generally used would not be sufficient to cause a rapid breaking down of the egg chitin before carbonation takes place. It is, therefore, quite possible, with both lime-sulphur and caustic soda, that a stifling and case-hardening effect is produced which may either retard the ultimate hatching out of the egg, or even prevent this process taking place altogether.

On the continent, during the last few years, considerable attention has been devoted to

the use of oil emulsions, particularly for spraying in the dormant season. The use of these emulsions has been adopted not only for the destruction of scale and hibernating insects, but as a means of egg destruction. The class of oils used varies somewhat in character, but generally speaking, those obtained from the distillation of tar seem to be favoured, probably on account of their plentiful supplies and comparatively low cost of production. It has been shown by various workers in the field of economic entomology that oils, having a boiling point above 250°C., show a gradual diminution in insecticidal value with increase in boiling point, but there is reason to believe that this property may be only characteristic of certain oils. Recent work carried out has certainly indicated that oils for this class of work must be of a definite specification, and that all fractions of tar distillates are not necessarily efficient as egg destroyers.

Another extremely important factor is the complete emulsification of the oils, so that the resulting product is water miscible, otherwise there is considerable risk of subsequent damage to the sprayed trees. In the United States the proportion of oil emulsion to water for spraying purposes varies with the different makes, but in all cases a much higher concentration is necessary than growers have hitherto used in this country, ranging from five per cent. to ten per cent. There seems little doubt that some insects' eggs are more resistant to this treatment than others, particularly those of the Winter Moth (*Cheimatobia brumata*). This may be due to the difference in thickness of the chitinous covering of the egg. The action of these emulsions seems to indicate a gradual disintegration of the chitinous covering, with absorption of the oils inside the egg, causing a coagulation of the contained protoplasm.

Recent work carried out in France and Germany has shown that the fraction obtained in the distillation of tar, known as green or anthracene oils, possesses very high egg-destroying properties when used as an emulsion. There is, however, one drawback in regard to this class of oil; its composition varies to an extent depending upon the class of coal used in the making of the tar. This has been borne out by the experiences with this oil in this country, and, in consequence, varied results in egg-killing have been recorded.

In the trade the various fractions obtained during the distillation process are designated as a general rule, as ammoniacal liquor, light oils, creosote oils, heavy oils and anthracene oils, and the quality of these is largely determined by the temperature of carbonisation of the coal during the "coking" process, and the subsequent fractionation of the tar. Coke-oven tar differs somewhat from gas-works tar, because in the former the main object is to secure as high a yield of chemical bye-products, such as sulphate of ammonia, benzol, etc., as possible, leaving as a residue a very hard and compact variety of coke which is used in the smelting of iron, etc. In the manufacture of gas-works tar the object is to obtain as high a yield of coal gas as possible which will give a maximum heating value in British Thermal Units or Therms, with a minimum of tar.

In the fractionation or distillation of tar the temperature rises: the first portions of the distillate contain water with which the tar is always contaminated to a greater or lesser extent, and depending upon the extent of any previous dehydrating process. As the temperature increases the lighter and more volatile oils begin to distil over and comprise light paraffin hydrocarbons, carbon bisulphide, thiophene, benzene, toluene, and other benzoid aramatic hydrocarbons: the fractions have fairly well defined boiling points, and this offers a means of separating them during the first distillation process which is usually followed by a further redistillation of some of the lighter boiling fractions.

Between three and four hundred substances have been found in coal tar of which about 150 have been estimated and ninety or so have been definitely isolated. These substances can be broadly divided into neutral bodies, acid oils and basic substances, and each are characterised by the absence or presence of oxygen, sulphur or nitrogen. It is a remarkable

fact that out of the large number of substances present in tar, only four appear to have been obtained in a state of high degree of purity on a large factory scale. They are: benzene, toluene, naphthalene and phenol. The creosote oils contain anything up to forty to fifty per cent. of what are known as the phenols, of which carbolic acid boiling at 183.4°C. is the lowest number of the series, together with a certain amount of creosote salts or naphthalene.

The phenols or cresols form the basis of most of the modern disinfectant solutions used to-day, and have played an important part as winter washes in the past. Under laboratory conditions a seven-and-a-half per cent solution of emulsified cresylic acid (cresol) has been found to give 100 per cent. kill of silk worm eggs, but under out-door conditions the results have been most disappointing. This is, no doubt, due to either the vaporisation of the thin film of oil from the egg surface over a period of time, or to the washing off of the emulsion by rain soon after spraying, and before it has had an opportunity of drying out. This may explain the inefficacy of ordinary emulsified creosote oil as an ovicide under commercial conditions. *Theodore Parker.*

(To be continued.)

## FOREIGN CORRESPONDENCE.

### BUCAREST FLOWER SHOW.

At the annual show of fruit and flowers which was held in Parcoul Carol, on October 31 to November 4, 1926, much regret was expressed at the absence of H.M. The King of Roumania, owing to illness, and H.M. Queen Marie, who was away in America, as this is a great fête and exhibition for Bucarest, which is looked forward to for many months. The weather was splendid, the temperature being 30° Réaumur in the shade. The Roumanian Horticultural Society had the pleasure of the presence of H.R.H. Princess Elena, who opened the show, and was conducted round by the President, Mr. Charles Farando, and Mr. Garofid, Minister of Agriculture. Mr. Businocescu, Mr. G. Nicoleanu, General Coanda, General Condescu, Princess Bibesco, and the Austrian Minister and M. Savian Badulescu were also present.

The attendance was large and resulted in a good balance on the right side, which was very acceptable as the society desires to build a hall in which to hold its shows at any time in Bucarest. Every year the show becomes more interesting as some new novelty or different arrangement takes the public eye. This year vegetables were much more largely shown, and great credit was given to the Army and the Schools for the quality of vegetables they displayed. It was regrettable, however, that so few private gardens were represented, along with the nurserymen, to encourage gardening in Roumania.

The principal exhibits were from the gardens of the Palace of Mogosoaia, H.H. Prince G. V. Bibesco, managed by Mr. J. W. Funge, who takes a keen interest in introducing new plants into Roumanian gardens, and succeeded on this occasion with a grand display of Carnations on a table of five metres length, with one end filled with new Dahlias. Grapes were also shown in style and quality that has never before been equalled in Roumania; the varieties were Marshal Gallien, Gros Colmar, Muscat of Alexandria, Madresfield Court and Lady Downe's Seedling (Gold Medal). M.M. Stefan and Auton Demitrievici, nurserymen, showed a finely arranged group of Begonias, Ficus, Asparagus varieties, and very large pink Chrysanthemums (Gold Medal). Mr. Toma Kraus, Carnation specialist, Codlea, Brasov, showed Carnations in great variety and good form mixed with Cyclamens, and edged with Ferns (Gold Medal). M.M. John Preidt and Co., had a grand display of Cyclamens with Liliun longiflorum (Gold Medal). Mr. J. Ollerer, Targul Mures, made a fine show with Primula obconica, very large and well-grown, edged with Cyclamens carrying over fifty blooms on one plant (Gold Medal). Mr. Théophile Scheidegger, nurseryman, Bucarest, displayed a round group of the finest decorative plants, well-arranged, including many new varieties (Gold Medal).

From the Royal Palace gardens, managed by Mr. F. Rebhuhn, came an exhibit that filled the whole end of the chief pavilion; it consisted of decorative plants, groups of Cyclamen, Primulas, and some very fine white Bouvardias (Hors Concours). Mr. Alois Kaurek, Bucarest, put up a very fine arrangement of packets of seeds, conserved fruits and different kinds of implements (Gold Medal).

In the No. II Pavilion, Messrs. Charles Farando and Sons, Bucarest, filled one side with Palms, Ferns, and other foliage plants, also groups of Chrysanthemums of great size and colour; great credit is due to their Chrysanthemum specialist Mr. Maes, who, year after year, brings his plants to perfect condition. The varieties included Kara Dow, Paul Oudot, Mrs. Kelly, Pink Turner, Captain Fox and Ville de Paris. This firm also showed fruit trees in good, clean condition (Gold Medal and Compliments). The rest of the Pavilion was filled with vegetables of good quality by the Horticultural Schools and the Army Vegetable Department.

The third Pavilion was entirely filled with fruits grown out-of-doors; the quality was very good indeed, but many of the exhibits were poorly arranged. Awards were given according to merit. J. W.

## FRUIT REGISTER.

### PEAR GLOU MORCEAU.

At the present time this Pear stands out as one of the most valuable fruits, and its habit of ripening slowly is not the least of its virtues. A tree I have on a west wall never fails to produce a crop which usually requires some thinning. Both in France and in this country this variety is not considered one of the hardiest, but this question-begging word has to be carefully considered. Trees in the open do not, with me, produce good fruit, but the variety is hardy in the sense that with the protection of a wall, fruit can be produced quite well, even in the north. I have recently had very fine specimens sent me from a correspondent in Aberdeen, who finds it one of his most reliable varieties. It would be interesting to know if any of your readers have been successful so far north as this. Edward A. Bunyard, Maidstone.

### APPLE NORFOLK BEAUTY.

NORFOLK Beauty is an excellent culinary Apple, in season from October to December; the fruits are large, of a rich golden tint and somewhat resemble Warner's King in general appearance, but are of a richer colour.

The tree makes a fine bush or pyramid and is a regular cropper; it is self-sterile.

This fine Apple was raised by Mr. Allen, of Gunton Park, from Waltham Abbey Seedling crossed with Warner's King, and it has proved, in the west of England, a variety of great value. Ralph E. Arnold.

### APPLE ALLINGTON PIPPIN.

ALLINGTON PIPPIN is, in many districts, a really good dessert Apple, but although it crops and grows well here, its flavour is second rate, and only pressure of other work has prevented me from heading our trees back and grafting them with another sort.

About a year ago, I was remarking this to a friend of mine who had also formed the same opinion of it, and he advised me to use the fruits for cooking as he had done. I am more than pleased that I followed his advice, as I find the fruits are excellent when used this way. T. B., Newbury.

### APPLE ARTHUR TURNER.

This variety of Apple is one of the best of the newer culinary sorts, and gained the R.H.S. Award of Merit on September 24, 1912.

The fruits are somewhat conical in shape and about as large as those of Lord Grosvenor. The tree makes robust growth and crops freely; the fruits are in season from November to December. The quality of this new Apple when cooked is exceptionally good, and the variety may be recommended to those who intend to add a few new sorts to their collections. T.

## VEGETABLE GARDEN.

### COMMON SCAB OF POTATOS.

COMMON Scab of the Potato spoils the appearance of the tuber and affects, to some extent, the cropping capacity of the plants. I have never encountered any kind of soil treatment which is remedial, and spraying is out of the question. As the malady was rather prevalent in the soil of a demonstration plot under my charge, I decided, early last year, to plant the seed tubers on humus in the hope that this material would act as a decoy for the fungus. Well-rotted leaf-mould was conveyed from a wood near-by and spread in the rows at planting time. The tubers were planted on this material and the crop, when lifted, was almost free from scab. There was scab here and there on the tubers, but it had to be looked for. The food in the leaf-mould was supplemented by a dressing of inorganic fertilisers.

Great credit is due to Dr. Millard of Leeds University for his work in this connection, and to him I am indebted for the knowledge of the treatment which I possess. Lawn mowings are said to have the same beneficial effect as leaf-mould, and as grass mowings are plentiful in most gardens, there seems to be no reason why gardeners should be troubled with common scab on their Potatos. Geo. H. Copley, N.D.H.

### EARLY CARROTS IN FRAMES.

In the production of early crops of Carrots under glass a mild, long-lasting hot-bed is essential, for, while the assistance of artificial warmth is necessary, at no time should the heat be very strong. Moderately dry leaves furnish excellent material for a hot-bed, and those who have an ample supply may employ them exclusively, but where stable manure can be obtained, it should be brought into requisition and used in conjunction with the leaves. Where leaves are not available, some little additional care will be necessary in the formation of the beds, because of the tendency of stable manure to ferment quickly, and as soon lose its heat, to the detriment of the crop. In this case, it is wise to collect any available littery material and other garden refuse to mix with the manure. Adding such refuse to other fermenting material is, it may be added, an excellent way of converting it into manure and rendering it available as a dressing for the kitchen garden or flower borders later.

Leaves alone do not require any preparation, and they may be formed into beds direct from the heap, be covered at once with soil, and the seeds sown without any risk of injurious results. With stable manure and litter some preparation will be necessary to ensure thorough mixing, but, if the material is well shaken out when thrown into a heap, once turning should suffice to bring it to a suitable condition for use. At this season of the year it does not often happen that fermenting materials will require moistening when being prepared for the beds, but if there is any tendency to dryness it will be necessary to sprinkle it with water when building up the heap. In preparing beds in brick-built pits it will suffice to fill them to within about six inches of the glass with the fermenting material, taking care that this is thoroughly consolidated to ensure a steady and lasting warmth and prevent undue sinking of the surface from the glass. The beds for portable frames should be made large enough to project two feet beyond the edges of the frame, as a more uniform heat will then be maintained.

Immediately on the formation of the bed the frame should be placed in position and the surface covered with about six inches of light and moderately rich soil. Old, sandy soil from the potting shed, to which a little clean leaf-soil may be added, answers admirably for this purpose. The seeds may be sown broadcast or in drills, but broadcast is the more economical system if sown regularly and not too thickly.

The management of the frames after sowing is a very simple matter and may be summed up in a few words. Until the plants begin to make their appearance, no ventilation will be required

beyond what is necessary to allow excessive atmospheric moisture to escape. Subsequent moderate ventilation will be required when the weather is favourable. It follows, as a matter of course, that the soil must be maintained in a moist condition without being at any time excessively wet, and that the frame must be covered with mats or other protective material in frosty weather. The best varieties for frame culture are Early Gem, Inimitable Forcing, Earliest French Horn and Golden Ball. W. Auton.

## HOME CORRESPONDENCE

**Failure with Celery.**—With reference to the letter by E. O. Stockbridge, in your issue of January 1, it may interest some of your readers to hear how my gardener, Mr. C. Crane, successfully fought the disease here. Our soil is clay, well broken up and mixed with burnt garden refuse. The seeds (Sutton's A.L. red; Dwarf Gem, white; and Solid White) were sown in the early spring. The earliest seedlings were pricked out into boxes, and the second batch on a hot-bed; in both cases the tap-root of each seedling was removed. Disease broke out in both lots and the diseased leaves were pricked off. In due course, the Celery was planted out in three double rows, about thirty yards long, the plants being quite one foot apart; farmyard manure was used in the trenches, with burnt garden refuse, mixed with a little chicken manure, as a top-dressing. The disease was still prevalent in the trenches, and two barrow-loads of outside leaves were removed and burnt. Spraying took place early in June (two pounds blue stone, two-and-a-half pounds soda, ten gallons water), and spraying was repeated every fortnight, until the foliage looked quite blue. The spray was applied by means of a knapsack apparatus, the nozzle being turned up so as to moisten the underside of the leaves thoroughly. The resulting crop is very good; I am sending you three sticks in a separate package as a sample. R. U. H. Buckland, The Locks, Hurstpierpoint.

[The heads of Celery were of fine size and excellent in every respect.—EDS.]

**Biennial Cropping of Apples.**—I was surprised to see *Market Grower* (page 17) advocating the belief in biennial cropping of Apples. I have read his articles on the "Market Fruit Garden" in *The Gardeners' Chronicle* for years, also his predecessor's, who wrote under the name of *Southern Grower*, and considered the advice of both well-timed and to the point. *Market Grower* states that thinning the crop in any experiment he has heard of, has failed to check the tendency to biennial cropping. I can give him an instance of two trees of King of the Pippins which grew on different sides of a path; both had been planted at the same time and were fairly large trees, one fruited one year and the other the next. I thinned the branches and all weak spurs first, then thinned the crop to a very light one. After three years' treatment both trees fruited annually and carried what I consider good crops. My own opinion is that when thinning is done it is not drastic enough; the tendency to leave too many fruits in case some drop is always paramount in the worker's mind. If it is carried out as a routine practice on *Market Grower's* farms he is lucky if he finds subordinates willing to thin sufficiently to permit trees to bear a crop the following year. Any fruit tree, if over-cropped, will take a rest the following year to recuperate, just as a man who, if overworked, would have to rest. Has *Market Grower* noted how orchard house trees bear annually when under glass protection and not exposed to the vagaries of the weather? No doubt manuring helps them as they are generally manured and well looked after every year. Manuring is not a cure for biennial cropping unless drastic thinning is practised at the same time. A man has to eat and digest his food before it can do him any good; the same applies to manuring soil. The soil has to receive and "digest" the manure before it becomes plant food. Grigor Roy.

## SOCIETIES.

### ROYAL HORTICULTURAL.

JANUARY 11.—The first meeting of the year was responsible for a bright and attractive show. Orchids were the principal feature, and of these there were groups of splendid plants from the principal trade and amateur growers.

The Orchid Committee recommended two First Class Certificates and six Awards of Merit. There was only one novelty before the Floral Committee but it did not receive an award, nor did the Fruit and Vegetable Committee recommend any award to a novelty. There was a magnificent exhibit of vegetables from Messrs. SUTTON AND SONS. The chief general flowers were *Euphorbia pulcherrima*, in a large group, and Carnations.

#### Orchid Committee.

Sir Jeremiah Colman, Bart. (in the chair), Mr. Gurney Wilson (Secretary), Mr. C. J. Lucas, Mr. F. J. Hanbury, Mr. H. H. Smith, Mr. A. Dye, Mr. H. T. Pitt, Mr. A. McBean, Mr. J. Cowan, Mr. G. E. Shill, Mr. H. G. Alexander, Mr. T. Armstrong, Mr. S. W. Flory, Mr. Stuart H. Low, Mr. E. R. Ashton, Mr. J. Cypher and Mr. F. R. Sander.

#### FIRST CLASS CERTIFICATES.

*Odontoglossum Vivien*.—From H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood). A beautiful hybrid with a tall spike of thirteen large, white flowers, each segment attractively marked with purple-red.

*Cypripedium Chardwar* var. *Perfection*.—From G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water, Gloucestershire (gr. Mr. W. H. Page). One of the largest of *Cypripediums*; the broadly-developed dorsal sepal is porcelain-white with dark purple dotting arranged in vertical lines; the petals are light greenish-yellow with brown reticulation.

#### AWARDS OF MERIT.

*Cypripedium Hancar* var. *George Corser* (Conference  $\times$  Major Hanbury *Carlie*).—From G. F. MOORE, Esq. A charming hybrid in which the roundly-formed, dorsal sepal is white, with a small, greenish base, and some slight spotting. The petals and labellum are honey-yellow.

*Cypripedium Chardmore* var. *W. H. Page*.—From G. F. MOORE, Esq. A noble flower with an unusually large, white dorsal sepal, with slight spotting on the central area, and a green base. The petals are broadly developed, veined and suffused with brown.

*Cypripedium Judah*, *Westonbirt* var. (*Alabaster*  $\times$  *Bronzino*).—From Messrs. H. G. ALEXANDER, LTD., Westonbirt, Tetbury, Gloucestershire. A handsome flower in which the dorsal sepal is white with a crimson-flushed centre. The petals are yellowish, tinged at the tips with violet; the labellum is shaded with reddish-brown.

*Cypripedium Renown* (*Eurybiades*  $\times$  *Christopher*).—From Messrs. CHARLESWORTH AND CO., The large flower has the dorsal sepal flatly displayed, white on the upper two-thirds, the lower part light green, and with slight spotting. The petals are honey-yellow with brownish markings.

*Odontonia Joiceyi* var. *Aleppo* (*Odontonia Pittiae*  $\times$  *Odm. Tityus*).—From Messrs. CHARLESWORTH AND CO. The principal feature is the rich purple colour of the broadly developed labellum. The dorsal sepal and petals are purplish tinged, with crimson.

*Sophro-Laelio-Cattleya Isabella* var. *perfecta* (*C. Fabia*  $\times$  *S.-L.-C. Marathon*).—From Messrs. COWAN AND CO. This plant bore a couple of charming flowers of soft cerise colour; the labellum is bordered with purplish-crimson and has a golden centre.

#### PRELIMINARY COMMENDATION.

*Vuylstekeara Elatior* (*Vuylstekeara Aspasia*  $\times$  *Odm. Miguelito*).—From Messrs. CHARLESWORTH AND CO. An immature seedling of much promise,

The plant bore a single flower of uniform rose-cerise colour; the labellum is very much larger than the other segments.

#### CULTURAL COMMENDATION.

To Mr. JOHN EVANS, Colwyn Bay, for a finely cultivated specimen of *Cypripedium nitens-Lecanum* var. *Becktoniae*, with seventeen fully developed flowers.

Mr. F. W. THURGOOD (Orchid grower to H. T. PITT, Esq.), was awarded a Bronze-Lindley Medal for a superb example of *Eulophiella Rolfei* (*Peetersiana*  $\times$  *Elizabethae*), with an erect spike of thirty buds and flowers. A First Class Certificate was given to this hybrid on February 27, 1917.

#### GROUPS.

The principal group was the superb collection of *Cypripedium* hybrids from G. F. MOORE, Esq., V.M.H., Chardwar, Bourton-on-the-Water, every plant of which has been raised in his garden. The beautiful *Cypripedium* Sir Trevor was seen in three distinct varieties, while C. Gwen Hannen was staged in several forms, one bearing the varietal name album, in which the dorsal sepal is white, except for a small yellow base. The F.C.C. variety of C. *Perseus* and a richly-coloured flower of C. *Memoria* F. M. Ogilvie were seen to advantage. Two specially fine varieties of C. *Chrysostomum* were named respectively Grace Darling and Amy Moore. The front part of the group was prettily formed of the pure white C. *Boltonii*, and the bright yellow *Oncidium cheiroporum*.

H. T. PITT, Esq., Rosslyn, Stamford Hill, had an interesting group in which were arranged the rare *Epidendrum Laucheanum*, *Eria globifera*, the large-flowering *Lycaste Skinneri* var. *Mrs. Hamilton Smith*, *Cymbidium Tracyanum*, C. *Alexanderi*, with yellowish flowers, and, in the centre, a well-grown plant of *Coelogyne Mooreana*, with three spikes of white flowers.

Messrs. CHARLESWORTH AND CO., staged an extensive group, the central part of which contained a large variety of *Miltonia Bleuana*, *Trichopilia fragrans* and *Cypripedium Arthurianum*. Fine *Cattleyas* were shown in C. *Tityus* and C. *Oetho* (*Octave Doin*  $\times$  *Clotho*), while *Odontoglossum Wilckeanum aureum* had a long spike of golden-yellow flowers, and *Odm. Agapetum* one of red-coloured flowers. A pretty hybrid was seen in *Odontodia Joiceyi*, and a richly-coloured one in *Sophro-Laelio-Cattleya His Majesty*. *Laelio-Cattleya Momus* formed a good example of what can be accomplished by breeding from *Laelia pumila*.

Messrs. COWAN AND CO. staged two novelties in their group, one being *Cymbidium Chloe* (*Gammieanum*  $\times$  *Doris*), the other C. *Margaret* (*insigne*  $\times$  *Sibyl*). In the centre was *Cattleya Zora* (*Gaskelliana*  $\times$  *Percivaliana*) a useful mid-winter hybrid; *Brasso-Cattleya Nestor*, with flowers of large size; and B.-C. *Menda*, pure white. In the back row were two fine plants of *Zygopetalum Mackayi* and the now uncommon *Cypripedium Curtisii exquisitum*. A handsome *Cattleya* was staged in C. *Woltersiana*, and a pretty *Cymbidium* in C. *Phillida*.

Messrs. BLACK AND FLORY arranged an effective group containing *Cypripedium* J. M. Black, C. *Glorita*, golden-yellow and C. *Norman* (*Senator*  $\times$  *Persus*). A plant of *Brasso-Cattleya Alderman* bore large flowers of rose-pink colour, and another of *Laelio-Cattleya Edzell* had blooms of rosy-mauve. Among the hybrids derived from *Sophronitis grandiflora* were *Sophro-Cattleya* S. W. Flory and S.-C. *Wellesleyae*. The flowers of *Sophro-Laelio-Cattleya Heatherwood* were more richly coloured than usual.

Messrs. SANDERS had an interesting group of species and hybrids. The former comprised *Cirrhopetalum gracillimum*, C. *Makoyanum*, C. *breviscarpum* and *Bulbophyllum Watsonianum*. Well-flowered plants were also staged in *Vanda Watsonii* and *Epidendrum fragrans*. *Laelia autumnalis* and *Cymbidium Doris* made a pretty effect, as also did *Odontoglossum Rossii*, when massed together. In the front of the group were many of the best *Masdevallia* species. One other noteworthy plant was *Lycaste Skinneri* var. *Adonis*.

Messrs. STUART LOW AND CO. showed *Dendrobium Cymbidioides*, with ten spikes, *Pleurothallis Roezlii*, the showy *Laelio-Cattleya Firminii*, L.-C. *luminosa aurea*, with yellow sepals and petals, L.-C. *Linda*, very pretty, and *Odontodia Wilsonii*. A special feature was the fine strain of *Brasso-Cattleyas*, the best of which were named *Hannibal* and *Juliet*, respectively. *Cymbidium Schlegelii* proved the decorative value of its section.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr. Mr. J. Collier), exhibited many interesting varieties, including *Bulbophyllum lemniscatum*, *Angraecum maxillare* and *Cirrhopetalum refractum*, commonly known as the "Windmill Orchid." Other plants were a large specimen of *Masdevallia tovarensis*, *Dendrobium bellatulum*, and a couple of distinct varieties of *Masdevallia Chimaera*.

Baron BRUNO SCHRODER, Englefield Green, Surrey, exhibited a number of very fine, cut spikes of the beautiful *Calanthe Harrisii*, the pure white flowers being much appreciated at this season of the year.

Mr. HARRY DIXON, Wandsworth Common, staged several attractive *Cypripediums*, *Odontoglossum Wilckeanum aureum* and *Brasso-Cattleya Nestor*, the last with large flowers of rose-pink colour.

Messrs. A. J. KEELING AND SONS showed *Cypripedium Elise*, with bold, dark spotting, C. *Memoria* F. M. Ogilvie, and the F.C.C. variety of C. *Florence Spencer*.

Messrs. J. CYPHER AND SONS showed *Cypripediums* finely, including *Queen of Italy*, *Nubia*, *Archie Neil*, and one named *Miss Cann*, with no fewer than fifteen flowers. The beautiful *Cypripedium Moonbeam* was in the front row, along with *Angraecum distichum*.

LADY LEON, Bletchley Park, showed a *Cypripedium* hybrid between *Hercules* and *Lyon*.

#### Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. Arthur Turner, Mr. H. R. Darlington, Lady Beatrix Stanley, Mr. H. J. Jones, Mr. J. M. Bridgeford, Mr. R. Findlay, Mr. W. H. Page, Mr. M. C. Allwood, Mr. Donald Allan, Mr. E. R. Jones, Mr. A. E. Vasey, Mr. James B. Riding, Mr. W. B. Gingell, Mr. D. B. Crane, Mrs. Helen Lindsay Smith, Mr. W. P. Thomson and Mr. Charles E. Pearson.

Section B.—Mr. Gerald W. S. Loder (in the chair), Mr. W. G. Baker, Mr. F. G. Preston, Mr. L. R. Russell, Mr. T. Hay, Mr. Charles T. Musgrave, Mr. G. H. Wilding, Mr. Reginald Cory, Mr. W. B. Cranfield, Mr. G. M. Marsden-Jones, Mr. James Hudson, Mr. W. J. Bean, Mr. G. Yeld, Mr. E. A. Bowles, Mr. R. C. Notcutt, and Sir William Lawrence, Bt.

#### GROUPS.

A very large group of *Euphorbia pulcherrima* varieties, (*Poinsettias*) shown by the Hon. VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree, made a bright display at the end of the Hall. In addition to a great many of the scarlet species there were a goodly number of the pale rose (*E. p. rosea carminata*), and the white varieties. Surmounting these showy plants were three large and well-grown specimens of *Kentia*.

With a comparatively few plants of *Camellia*, *Hippeastrum*, *Acacia*, *Cyclamen* and *Primula obconica*, surrounded with green moss, Messrs. STUART LOW AND CO. made a very attractive display. Messrs. L. R. RUSSELL, LTD., had excellent little plants of *Aphelandra squarrosa*, *A. aurantiaca*, *Azalea indica* varieties, and pretty little bushes of *Oranges* in full fruit.

Spring flowers, shown by Messrs. CARTER AND CO., included large baskets of white *Hyacinths*, *Narcissus Grand Soliel d'Or*, *Primula sinensis* in various colours and also the graceful *stellata* varieties. Messrs. BOUND AND SON staged excellent plants of *Lachenalia Boundii* and *Asparagus plumosus Boundii*, both of which received Awards of Merit in December, 1925. Even at this time of the year, the graceful *Asparagus* plants were growing vigorously, and the *Lachenalia* flowers were of rich, deep coral-red colour.

Carnations were shown in good quality by Messrs. C. ENGELMANN, Messrs. STUART LOW AND Co. and Messrs. ALLWOOD BROTHERS. The first-named had showy vases of Saffron, Topsy, Jazz and Spectrum. Messrs. STUART LOW AND Co. gave special prominence to large vases of Sybil, Brilliant and Spectrum, while, in addition to vases of perpetual flowering Carnations, Messrs. ALLWOOD BROTHERS staged many flowers of their *Dianthus Allwoodii* in various colours. Many bunches of fragrant Violets were shown by Mr. J. J. KETTLE.

In a well-arranged rock garden, Messrs. Wm. CUTBUSH AND SONS displayed various shapely Conifers, with groups of *Bulbocodium vernum*, *Iris Histrio*, *Primula Wanda* and others spring flowers. Messrs. J. CHEAL AND SONS set up a low rockery and planted it with *Primula malacoides*, *Eranthis cilicia*, *Scilla sibirica alba* and *Galanthus Elwesii*.

THE ORPINGTON NURSERIES Co. exhibited a valuable selection of shapely little Conifers, such as are planted in rock gardens. The principal genera were *Cupressus*, *Juniperus*, *Abies*, and the garden genus *Retinospora*. Mr. J. KLINKERT set out a collection of topiary specimens in Box and Yew.

The exhibits of garden sundries included an exceedingly attractive span-roofed greenhouse erected by Messrs. BOULTON AND PAUL, which Mr. CLARENCE ELLIOTT filled with a goodly collection of alpine in pots. Messrs. THOMAS GUNN, LTD., had various cutting tools of good appearance. THE CHASE CONTINUOUS CLOCHE Co. had various samples of their speciality, and Messrs. ABBOTT BROTHERS showed many of their bird-nest boxes.

There were a great many paintings of flowers and garden scenes. The chief exhibit was by Mr. FRANK GALSORTHY, who included studies of Orchids, Narcissi, Irises, Frezias and general garden flowers.

#### Fruit and Vegetable Committee.

**Present:** Mr. C. G. A. Nix (Chairman), Mr. H. S. Rivers, Mr. P. C. M. Veitch, Mr. P. D. Tuckett, Mr. W. F. Giles, Mr. E. Beckett, Mr. A. Bullock, Mr. A. C. Smith, Mr. A. Poupart, Mr. G. Kelf, Mr. H. Markham, Mr. E. A. Bunyard and Mr. A. N. Rawes.

Three seedling Apples were submitted to the Committee for award from Mr. J. S. PEEKE, Chalmleigh, Devon; Mr. J. C. IBELL, Stony Stratford, and Mr. W. J. BOYCE, Norfolk, respectively. None was considered any advance on existing varieties of similar season and type.

Mr. E. BECKETT, Aldenham House Gardens, Elstree, showed specimens of Artichoke Inseau, which variety, after being grown at Wisley, was highly commended at the previous meeting.

Messrs. SUTTON AND SONS, Reading, staged a remarkably fine collection of almost every kind of vegetable that the kitchen garden affords at this time of the year. There were 140 dishes of distinct kinds and varieties, each being a perfect sample of its type. The general effect of the exhibit was very imposing, as not only was the quality superb, the grouping was done with great skill, the great variety of colour in the various subjects being utilised to the fullest advantage. Broccoli Early White, Winter Mammoth, and Christmas White were prominently displayed along with superb Brussels Sprouts of the varieties Dwarf Gem, Fillbasket and Exhibition. Exceptionally fine specimens of Ailsa Craig Onions were arranged in the centre of the group, and other Onions shown well were Crimson Globe and A.I. Extraordinarily fine Tomatos, Parsnips and Carrots, Potatos and Cabbages were also included. Among the forced vegetables were splendid Seakale, Asparagus, Chicory, Endive and dwarf French Beans. Many visitors were attracted by the fine fruits of the "Tree Tomato" (*Cyphomandra betacea*). Variegated Kales were used as decorations on the stand.

Messrs. G. BUNYARD AND Co., LTD., Maidstone, staged a splendid collection of Apples and Pears, many of the varieties—there were seventy-six in all—being little-known sorts. Among the outstandingly good samples we noticed Sandling, Pederstrup Reinette, Challey's Kernel, Golden Delicious, Edward VII, Lord Burghley, Cutler

Grieve, Wagener and Brownlee's Russet. Of the Pears, Catillac and Comte de Paris were prominent varieties. In a season that will go down in history as a poor one for Apples, this display by Messrs. BUNYARD was particularly meritorious.

### Obituary.

**H. C. Dresselhuys.**—It is with great regret that we record the death, on the 16th of December, of Mr. H. C. Dresselhuys, of The Hague, Holland, President of the Netherlands Gardening Council. He was well-known as a grower of Dahlia novelties, of which he raised a great number.

**Sir Benjamin Faudel-Phillips, Bart.**—We regret to record the death, at Balls Park, Hertford, on January 11, of Sir Benjamin Samuel Faudel-Phillips, the second baronet. For some time past, Sir Benjamin had been in indifferent health, and his death at the comparatively early age of fifty-five years is a distinct loss to gardening in this country, for he had an enthusiastic love of horticulture and, with such a skilful gardener as Mr. F. W. Fitch, made his gardens at Balls Park among the most beautiful in the country. He was unmarried, and is succeeded by his brother, Mr. Lionel Faudel-Phillips.

**W. A. Miller.**—Mr. Henry Miller, of Messrs. Carter Page and Co., sends us information of the death of his brother, Mr. W. A. Miller, recently residing in Canada, and at one time a contributor to these pages. Mr. W. A. Miller was born in 1854 and entered the service of the late Earl of Bective as gardener at Underley Hall, Kirkby Lonsdale, Westmoreland, in 1878; after the death of the Earl, he continued his service with Lady Henry Cavendish-Bentinck until 1924, when he retired and went to Canada to join his three sons who are fruit farming in Ontario. He passed away at St. Catharines, Ontario, on December 6, 1926, after one day's illness, aged seventy-two.

**F. Petersen.**—We regret to learn of the death, on the 5th of December last, at the advanced age of eighty, of Herr August F. Petersen, the well-known nurseryman and florist of Hamburg. In November, 1846, Petersen took his first lessons in practical horticulture in his father's nurseries at Plön, in Holstein, and later increased his knowledge and experience by travelling. After the war of 1870-1, he established a business in a new suburb of Hamburg, where there was much scope for his talent for laying out new gardens; he also had a florist's shop, in which he was assisted by his wife, who was very clever in all branches of the art. Good fortune attended all his efforts, the business grew and prospered, and a few years ago he had the pleasure of celebrating the fifty-years' jubilee of his entry into business on his own account in a large and happy party of his own children and grand-children. Herr Petersen was popular as well as successful, his kindly nature and warm heart endearing him to all with whom he came in contact. He was devoted to his craft, and was a true gardener in the best sense of the word. His sons will carry on the business of which their father so well established the foundations.

#### GARDENING APPOINTMENTS.

**Mr. W. G. Crockett** for the past six years gardener to JOSEPH SHAW, Esq., K.C., Kentchurch Court, Near Hereford, as gardener to the same gentleman at Adderbury House, Banbury, Oxon. (Thanks for 2/6 for R.G.O.F. Box.—Eds.)

**Mr. C. Fletcher** recently gardener to R. O. Fordham, Esq., Broom Hall, Biggleswade, and previously gardener to FRANCES, COUNTESS OF WARWICK, Easton Lodge, Dunmow, as gardener to THE GOVERNORS OF STOWE SCHOOL, Stowe, Buckingham.

**Mr. E. H. Griffiths** who has travelled for Messrs. W. CUTBUSH AND SONS, LTD., during the past five-and-a-half years, has been appointed representative in the South-western Counties for Messrs. JAMES CARTER AND CO., Seedsmen to His Majesty the King, Raynes Park, London, S.W.20.

### ANSWERS TO CORRESPONDENTS.

**FLOWERS TO FOLLOW CHRYSANTHEMUMS.**—*M. C. (East Lothian.)* Your greenhouse of sixteen feet by thirty feet, is so small for commercial gardening that we should imagine it would pay you better to keep it well-filled with bulbs after the Chrysanthemums, than try to grow three or four other crops, especially as the temperature you maintain in it is only 60°. It is more economical to have a lot of one or two crops than small parcels of several crops. However, if you can sell *Myosotis*, early-flowering plants could be brought on in the house. Christmas Roses (*Helleborus niger*) might also be tried. A temperature of 65° to 70° is best suited to Cress. Early short, round Carrots, like Grelot, and frame Radishes and early Cabbage Lettuces should do well, if you can make up beds of rich soil; and Mint should prove a good early crop. But your house will not be able to accommodate them all. Commercially, we should choose Mint and Radishes after the bulbs.

**NAMES OF PLANTS.**—*W. H. W.* The weed on the lawn is *Cerastium vulgatum* or Mouse-ear Chickweed. It occurs in every county of Britain, and is dispersed over great parts of the northern hemisphere of the Old World. The plant is perennial, a frequent pest of lawns, and the creeping, barren shoots are so interlaced with the grass that they cannot be pulled up or spudded out. The leaves are so protected by hairs that repeated applications of lawn sand or sulphate of ammonia may be necessary to reduce the weed. The remedy is most effective in dry weather, when the grass also is dry.

**VINE BORDER.**—*H. W.* The depth of the border in your span-roofed vinery should be two feet six inches, when settled down, as a border less than this depth is apt to dry out quickly and also requires much greater care and attention in watering to maintain the proper degree of moisture. On the contrary, a deeper border often becomes too wet, the roots penetrate deeply and disease follows. Much depends on the nature of your soil; in wet and cold, clayey soils it is advisable to cement the bottom of the border to keep the roots from descending; this cement base should have a gentle slope to the outlet to carry the water away freely. Washing of the walls with cement should be sufficient. Over the base place nine to twelve inches of rough bricks or similar materials, lay drain pipes amongst the drainage and cover with lime rubble, as a thorough system of drainage is of the utmost importance. On cold soils a raised border has many advantages, being warmer and dryer, but a great deal depends on the construction of the house and other circumstances. On no account make up the border all at once, three feet or four feet wide is ample for the first two years, adding to the border every alternate year. Good Grapes may be grown in any good garden soil, but the soil best suited to the requirements of vines is a brown, calcareous loam with other proper materials added, such as burnt earth, lime rubble, wood-ash and charcoal. Lay turves grass-side downwards over the drainage, and also to form the front wall; chop up other turves roughly and to each ton of loam add one hundredweight of coarse bone-meal, half-hundredweight of vine manure, a little charcoal, and the other ingredients according to the quality of the loam; as a matter of course, heavy loams require more lime-rubble than sandy loams. Mix the compost thoroughly, use it when dry, and make the border firm as the work proceeds, planting the vines three-and-a-half feet apart for single rods. Black Hamburg, Madresfield Court, Alicante and Muscat of Alexandria are all good growers, free in cropping and of good quality. Plant the Muscat at the warmer end of the house, or, better still, in a house by itself. If you wish to try other varieties, Appley Towers and Chasselas Napoleon might be added.

	Violets ... 3 0-5 0

REMARKS.—Supplies all round are on the increase, but prices are on the down grade. There has been a greater demand for the country trade during the past week. Supplies of Chrysanthemums are practically finished, especially of coloured varieties. Spray white and disbudded blooms are the most plentiful but their prices are firmer. The quantities of Daffodils and Tulips have increased daily, and prices have been greatly reduced; the Tulips include Wm. Copland, La Reine, Yellow Prince, Montessor, Salvator Rosa, Thos. Moore, Vermilion Brilliant, Couronne d'Or, Prince of Austria and Prosperity. All Lilliums are cheaper owing to increased supplies. Larger quantities of flowers are being received from the Channel Islands; they consist of white and yellow Narcissus, Freesias, Violets, Anemones and Sinilax. White and mauve Lilac is arriving from Holland in first-class condition; there is also a good supply of Tulips

from Dutch growers, but they are not so fine as those from home-growers, although they arrive here in excellent condition. The consignments of flowers from the south of France are more plentiful again and much better in quality. Anemones and Acacia (Mimosa) are more reliable, also single Violets. Paper White Narcissus and Narcissus Soliel d'Or have sold freely the former owing to a shortage of other white blooms. Marigolds and scarlet and carmine Ranunculus are now much finer in quality, although the qualities are somewhat limited, but supplies should show a further increase during the next few days, with a further reduction in prices generally.

Business is quiet, but for the time of year, conditions seem brighter than usual. Peaches, Apricots and Plums from South Africa arrive in good condition and meet a steady demand. The Apple trade is slow, but some English Bramley's Seedling, which have been well stored, are selling extremely well. Hothouse Grapes are a poor market and prices are high for both English and Belgian sorts. Hothouse Beans are scarce and maintain an exclusive figure. Beans from Madeira are not plentiful but sell fairly well at firm prices. Mushrooms are in better supply, the open weather being favourable to production, and quotations are easier. New Potatoes, mainly from Guernsey, are more plentiful and cheaper. Cucumbers maintain a high price level, arrivals being very scanty. Green vegetables are a very variable business, and, on the whole, not altogether satisfactory to producers. Salads, principally from France, are increasing in quantity, but are in active demand and selling well. Potato trade conditions are steady at recent improved figures.

## GLASGOW.

All the departments of the market were quiet during the first week of the year. In the cut flower section the daily supplies were on a much smaller scale and price movements were all in a downward direction. Roses, for instance, were only worth half their previous value at 6/- to 8/- per dozen for pink; 4/- to 6/- for red; and 3/- to 5/- for white varieties. Carnations at 4/- to 6/- did not suffer to the same extent, while Lilac at 1/6 to 2/- per bunch and Narcissus at 4/- to 6/- per dozen bunches kept steady. Tulips offered a better solution, but values were not so good as they were in the previous week. W. Copland only made from 1/- to 1/6 for 6's; Thomas Moore, Montessor and Le Matelais, 1/- to 1/3; Couronne d'Or and Vermilion Brilliant, 1/3 to 1/6; and white varieties, 1/- to 1/2. The few Chrysanthemums that are still coming into the market from one of the local growers were disposed

of at the following prices: Favourite, 10d. to 1/2; Winter Cheer, 10d. to 1/-; Heston White, 8d. to 1/-; and Wilcox, 8d. to 10d. Tulips in pans were not in less demand at 1/- to 2/- each.

Valencia Oranges dominated the fruit market and in consequence of the scarcity caused by the prevalence of frost and snow in districts where such weather conditions have not been experienced for many years, prices advanced from 4/- to 5/- per case. At the auction sales 300's brought from 21/- to 24/-; 360's, 17/- to 20/-; 504's, 16/- to 17/-; 420's, 26/- to 28/-; and extra large fruit, 40/-; 714's, 28/- to 30/-.

## TRADE NOTE.

MESSRS. G. Monro, Ltd., whose various establishments are amongst the most important in Covent Garden market, have acquired the premises recently occupied by the Ministry of Labour in Tavistock Street, for their Country Order Department connected with their flower and plant business. The old premises of the Floral Postal Order Department at 5, Tavistock Street, will, we understand, be utilised for their extensive business in foliage which the firm has developed extensively in the past year or two; during Christmas week it was utilised for the Christmas tree section of the business. The variety of "foliage" subjects handled by the firm is very extensive and includes many kinds of Cupressus and other Conifers, Box, Ivy, Laurel, Bay, Myrtle, Pittosporum, Galax leaves, Holly, Berberis, Ruscus, Gieslinia, Rosemary, Rhododendron, Camellia, Fern and Asparagus in variety, Smilax, Lichen, Moss, and, in their season, such deciduous trees as Beech, Sweet Chestnut and Oak.

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to advertisers of vacant situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

### COUNTY BOROUGH OF BURNLEY. PARKS DEPARTMENT.

THE Corporation of Burnley invite applications from experienced gardeners for the position of FOREMAN in charge of a public park. Candidates should be between 30 and 40 years of age, with good, practical experience, fully qualified in propagating hard- and soft-wooded plants, preparing cut flowers and arranging floral displays in bedding, herbaceous and otherwise.

The salary will be £228-35 per annum, being the maximum year of Grade C1 of the Corporation's Grading Scheme, which salary will be subject to variation in accordance with the cost of living. The successful candidate will be required to reside in the house provided, and to pay a rent of £14 10s. 0d. per annum therefor.

Applications must be submitted on forms to be obtained from the Borough Engineer and Surveyor, and delivered to him not later than Tuesday, the 18th January, 1927. Canvassing, either directly or indirectly, will be a disqualification.

COLIN CAMPBELL,

Town Clerk.

Town Hall,  
Burnley,  
January, 1927.

## PRIVATE.

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required; but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid it will appear the following week, unless countermanded in the meantime.

### PRIVATE.

**GARDENER, HEAD**, or manage small estate; thoroughly experienced, capable organiser and manager; age 36 years; 22 years' experience, 11 years as head, 64 years present situation, and changing for a progressive situation.—P. H. G., Box 44, 5, Tavistock Street, Covent Garden, W.C.2.

1927, a record of 86 years of sound construction.

GOOD Greenhouses last—others do not.

The ROBIN HOOD BOILER  
reduces the fuel bill and saves labour.

Estimates on application Free.

## The Butcher does not mend your watch

Typical Duncan Tucker Glasshouse

Can you imagine a man going into a Butcher's shop to have his watch mended? Hardly, yet there are plenty of men willing to jeopardise the safety of their Glasshouse by taking risks with it. They will frequently try to get their repairs done by carpenters or glaziers instead of relying on the experts. William Duncan Tucker and Sons Ltd. know all there is to know about Glasshouses—constructive and repair work alike. They have known for nearly a hundred years and their experience as specialists enables them to render invaluable assistance to hundreds of Glasshouse owners.

### SURGICALLY CLEAN

Fruit trees must be cleansed now—not only of clinging insects and fungus, but of every life-germ that might later produce damaging pests. A doctor would call this "surgical" cleanliness—it is the kind that XL ALL gives. Of all nurserymen, seedsmen and florists.

XL ALL WINTER WASH.

G. H. RICHARDS LTD.  
234, Borough High St., London, S.E. 1.

CALDWELL'S Tested Seeds.—Attractive new Catalogue now ready, and will be gladly sent gratis on application. Quality of seeds is the very best obtainable. Established since 1780. Please write now to CALDWELL & SONS, The Nurseries, Knutsford.

### D'YE KEN JOHN PEED ?

He offers PEEDS' SEEDS  
in superb quality.

H. PATTISSON & CO., STANMORE, MIDDLESEX.

# SUTTON'S SEEDS

## PEDIGREE STRAINS OF VEGETABLES

At the first meeting of the Royal Horticultural Society in 1927 (Jan. 11th) Messrs. Sutton & Sons were awarded a GOLD MEDAL for a magnificent Collection of Vegetables. The display consisted of no less than 140 distinct varieties.

For reliability in cropping, excellent appearance and superior table quality our strains of Vegetables are unsurpassed.

Following are a few of our choicest varieties:

### PEA—SUTTON'S PHENOMENON

Acknowledged to be the Largest-podded Dwarf Pea in existence, per packet 3/6 and 5/-

### RUNNER BEANS—

#### SUTTON'S PRIZEWINNER

Indispensable for exhibition, pint 2/9, quart 5/-

#### SUTTON'S BEST OF ALL

Of wonderful size, universally grown, per pint 2/6, quart 4/6

### BROCCOLI—

#### SUTTON'S PEERLESS STRAIN.

Sutton's Early White, Snow-white, and Satisfaction, each, per packet, 1/6 and 2/6

### \*LEEK—

#### SUTTON'S PRIZETAKER

The finest strain in existence, per packet 2/6 and 3/6

### \*ONION—

#### SUTTON'S SELECTED AILSA CRAIG

The largest and heaviest cropping Onion, per packet 2/6, 3/6; ounce 4/6

### \*TOMATO—

#### SUTTON'S BEST OF ALL

The most popular Tomato both for private and market garden work, per packet 2/6 and 3/6

#### SUTTON'S EVERYDAY

A splendid Tomato, per packet 1/6, 2/6 and 3/6

\* These varieties were included in our GOLD MEDAL EXHIBIT, R.H.S., Jan. 11th.

Sutton's New Garden Seed Catalogue for 1927 contains a complete list of the best Vegetable Seeds, Flower Seeds, Seed Potatoes, Garden Sundries, Horticultural Fertilisers, etc., post free.

## SUPPLEMENT PLATE.

Pinus Laricio growing at Stanage Park.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.4°.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, January 19, 10 a.m. Bar. 30.1. Temp. 36°. Weather, Fine.

## The Fertility of the Garden.

SOILS, like facts, are stubborn things; yet, fortunately for the gardener, they are not quite so stubborn, for if coaxed and bullied sufficiently they may be so altered that their fertility is increased greatly. Both coaxing and bullying are necessary instruments for the training of the soil in the way it should go; though it must be confessed that of the two the latter is the more potent, as it used to be in the education of those of us who are now elderly. Once the fertility of a garden soil has been achieved it is not difficult to maintain it; but in these days it is far less easy, in spite of the great growth of knowledge of the science of the soil, to bring unkindly ground into a highly fertile state. Moreover, there are some soils which when brought under garden cultivation give for a year or two prodigious crops and then, as though growing tired of well-doing, regress to parsimonious yielding. Wherever this occurs the gardener may be sure that the falling away from grace is due to some defect in the essential conditions upon which a good soil depends,

and generally it will be found that the defaulting condition is insufficient drainage. A wetish year, or ditches left uncleaned, may result in the winter water-logging of a soil which had previously seemed well on the way to fertility. It is for this reason that every good gardener gives first attention to drainage in laying out his garden; for he knows that what is easy to do *ab initio* is troublesome and difficult to accomplish once the garden has been laid out. He is wise also in this, that he makes and preserves a plan of the drainage system, for he knows that within a few years the best of memories will grow dim, and long before the garden is fully established, it will assuredly happen with respect to the lie of the drainage tiles, that all the rest for which he toiled will be forgotten. In the old days it was possible, when plenty of labour was available, to ensure soil fertility by deep digging. The ground destined to become a garden was trenched three feet deep and all manner of material, which in its decay makes for soil fertility, was incorporated with the soil, so that even the unkindly turned up sub-soil was constrained to become kindly to the growth of plants. It is in some ways unfortunate that in our climate less drastically sound methods often lead to a measure of success; for it tempts those who are in a hurry to forego the toil on which alone soil fertility securely rests. There are, however, countries where, unless the soil be stirred to at least a yard in depth, nothing will grow. On the Riviera, for example, anyone who would make a garden must, unless he would ensure failure, delve with mattock and shovel a full yard deep, for there, unless this be done, summer drought extinguishes anything recently planted, and the garden returns to natural scrub. In any case, if Pope, who was a gardener, had been thinking of soils instead of knowledge, he might have revised his famous lines and written "a little digging is a dangerous thing—dig deep or dig not."

Next, perhaps, in importance to drainage in the making of soil fertility is liming—liming on heavy, chalking for light soils—for, as everyone knows, soils have what is called a lime requirement which ranges from nil on chalky soils to a very high figure on the distinctly acid soils. This requirement is easy of ascertainment and must be satisfied if soil is to become fertile. For it is a fact that most of the plants grown in gardens—save, of course, the lime-shy contingents—thrive best when the soil borders on neutrality. It is certain that, speaking generally, the kitchen gardens of this country would be rendered more apt to become fertile if they were to receive, say, triennially, a dressing of lime in quantities in accordance with their several lime requirements. They would become kinder, the stiff ones easier to work, the light ones less skimpy as a result of the treatment and, moreover, they would all respond better to manurial treatment. With drainage satisfactory, ground dug deeply, and the lime requirement of the soil satisfied, the gardener has in his soil a well-equipped plant-factory which, if supplied with a sufficiency of the right kinds of raw material, will yield a large output in the form of heavy crops. But to secure this end and to maintain production it must be remembered that large crops make large demands on the soil. And not only that, but also that the demands are of more than one kind. Although it must never remain wet, the ground is obliged, if it is to produce a heavy crop, to yield to the growing plant vast quantities of water. Moreover soil fertility consists in no small measure in balancing

as it were, the water supply and air supply, which all plants must have. If too wet, the roots of the plants growing in the soil are asphyxiated; if too dry, they dry out. Hence the importance of depth of soil and efficient drainage. The one condition ensures a large reservoir, the other the removal of surplus water. When all these conditions have been established, the gardener can turn his attention to the problem of manuring, and this subject, as he well knows, has a dual aspect.

## Immune and Non-Immune Potato Crops Inspected in Scotland in 1926.

The Board of Agriculture for Scotland has issued interesting summaries on acreages of crops of immune and non-immune varieties of Potatoes inspected for purity in Scotland during 1926. In the following lists the varietal name is given first, then the acreage showing 99.5% of purity or over, next the acreage showing below 99.5% to 97% purity; then the acreage showing below 97% of purity and, finally, the total acreage inspected of the given variety.—Immune varieties: Kerr's Pink, 7,090½, 1,268½, 370½, 8,729; Great Scot, 5,423, 977½, 693½, 7,094½; Majestic, 4,187, 506½, 271½, 4,965; Golden Wonder, 1,829½, 187½, 31½, 2,048½; Ally, 657½, 53½, 14½, 726; King George, 384, 11½, 10, 405½; Arran Comrade, 198½, 29½, 35½, 264; Tinwald Perfection, 233½, 26½, 2½, 262½; Rhoderick Dhu, 208½, 41½, 5½, 255½; Crusader, 112½, 11, 11, 134½; Abundance, 89½, 20½, 15½, 125½; Witchhill, 80, 4½, 12, 96½; Arran Consul, 81, 2½, 6½, 90; Immune Ashleaf, 77½, 0, 1½, 79; Arran Victory, 62, ½, 1, 63½; Dargill Early, 51½, 9½, ½, 61½; and others, 332, 49½, 18½, 399; totals, 21,098, 3,199, 1,502½, 25, 799½. Non-immune varieties: King Edward, 11,856, 2,167½, 750, 14,773½; Arran Chief, 1,921, 579½, 576½, 3,076½; Epicure, 1,048½, 441½, 256½; 1,746½; Eclipse, 1,453, 130, 77, 1,660; British Queen, 1,038½, 249, 129½, 1,416½; Field-Marshal, 1,175, 57½, 78½, 1,310½; Sharpe's Express, 780½, 145, 87½, 1,013; Duke of York, 568, 70½, 60½, 699; Up-to-Date, 537½, 19½, 28½, 585½; Royal Kidney, 201½, 13, 6, 220½; May Queen, 130, 3½, 3½, 137½; Ninetyfold, 127½, 1, 3½, 132; Evergood, 78, 7½, 0, 86½; President, 42½, 12½, 8, 63; and others, 99, 21½, 18½, 139; totals, 21,057½, 3,919, 2,083, 27,059½.

**Rhododendron Society's Schedule.**—In the schedule of prizes offered by the Rhododendron Society on the occasion of its second show to be held in the Royal Horticultural Hall on Tuesday and Wednesday, May 3 and 4, no fewer than sixty-two classes are provided, and although the cash awards are not large in any instance, special prizes are offered and silver-gilt, silver and bronze medals will be awarded. The first half-dozen classes are for groups of Rhododendrons. The largest trade exhibits are limited to 250 square feet, while the smallest amateur group must not exceed thirty square feet in extent. In regard to these classes, Azaleas are reckoned synonymous with Rhododendrons, and no foliage other than Rhododendron foliage will be admitted as decoration. Further, in these six classes the Rhododendrons exhibited may be grown in the open or under glass, and unless particularly specified, the flowers may be shown either cut or growing on the plants. Then follow classes for twelve trusses of distinct species, twelve hybrids, six species, and six hybrids. All except three of the remaining classes are for single trusses of Rhododendrons, and these are so arranged that the principal series of groups of Rhododendrons may be represented. There is also a class for three alpine Rhododendrons lifted from the ground or grown in pots, one for six distinct trusses of hardy hybrids raised by nurserymen and capable of being grown and flowered in the open at Kew, and one for a group of alpine Rhododendrons in pots or lifted from the ground, arranged on a space not to exceed four feet by six feet. The schedule defines that for the purpose of this last group

an alpine Rhododendron shall be any of the Cephalanthum, Lapponicum, Lepidotum or Saluenense series or the Campylogynum sub-series of the Campylogynum series. For educational purposes the members of the Rhododendron Society will, on this occasion, arrange an exhibit of plants of the Lapponicum series. Mr. J. B. Stevenson, Tower Court, Ascot, has kindly agreed to take charge of this arrangement, and anyone who is willing to lend plants of this series for this display is asked to communicate with him, but while every effort will be made to return the plants in good condition, no guarantee can be given. All entries for the Rhododendron Show must reach the Secretary of the Royal Horticultural Society by 10 a.m. on Wednesday, April 27. The members of the Show Committee are Mr. Lionel N. de Rothschild (Chairman), the Hon. H. D. McLaren, Mr. J. B. Stevenson, Mr. E. H. Wilding, and Mr. P. D. Williams.

**The Problem of Potato Diseases.**—Speaking at a meeting of the Glasgow and West of Scotland Agricultural Discussion Society on the 12th inst., Mr. D. G. O'Brien, of the West of Scotland Agricultural College, said the estimated actual loss in Great Britain due to Potato Blight was about twenty per cent. of the crop, or about five million pounds sterling per annum. With control of disease the yield of Potatoes could be increased without difficulty. As to Wart Disease, this was, unfortunately, the only known disease where permanent immunity existed in certain varieties. Our knowledge of virus diseases in Potatoes was still unsatisfactory, and until the casual agents of virus and leaf-roll had been isolated and identified, there was little hope of progress. These diseases were much more prevalent in England than they were in Scotland. Mr. John Gibb, Bishopton, said that he had sprayed his Potato crops ever since he started farming and he found that to be effective the spraying should be done preferably before the flowers came out, or in the case of a non-flowering variety, when the flower buds appeared. In 1920 he lost time by trying to repair a sprayer, and this cost him £1,000 in lighter crops and lower returns. In most districts of Ireland, and in Lincolnshire and Cambridgeshire, Potatoes could not be grown profitably unless they were sprayed, and he felt that his farm was in the same position. The "wilding" habit of some Potato plants was a subject that required investigation.

**Chinese Pineapples.**—Messages from Singapore state that the decision of the recently formed combine of all local Chinese Pineapple factories to reduce production by thirty or forty per cent. is unpopular in mercantile circles there. Already the industry has suffered considerably on account of the combine's prices being higher than the London trade will pay. Of the million or so cases annually exported from Singapore, eighty per cent. has hitherto been taken by Great Britain.

**The Cherry Fly in France.**—French Cherry growers are keenly concerned about the edict published by the Ministry of Agriculture in London last year, prohibiting the export to this country of Cherries from France, unless accompanied by a certificate to the effect that they come from a part of the country in which the Cherry Fly (*Rhagoletis cerasi*) is known not to be present. The growers are inclined to discount the danger to English orchards, as they claim that, whereas only about 600 tons of English Cherries are grown each year, the importations from France amount to between 60,000 and 80,000 tons. However this may be, the danger is none the less, and unless the pest can be eradicated, the consumption of Cherries of all kinds, whether native or imported, is likely to decline.

**British Mycological Society—London Meeting.**—At a Meeting of this Society to be held in the Botanical Department, University College, Gower Street, London, on Saturday, January 22, at 11.0 a.m., the following subjects will be discussed: "Studies on Rhizoctonia Crocorum and Helicobasidium purpureum," by Mr. W. Buddin and Miss E. M. Wakefield "On the naming of a dark-spored

Hyphomycete," by Mr. E. W. Mason; *Fragmentia Mycologica, V*," by Mr. J. Ramsbottom; "Anthracnose diseases of Red Clover," by Miss K. Sampson; "Studies of Apple Mildew," by Mr. R. C. Woodward. Luncheon will be arranged in The College Refectory.

**Sir James Watt.**—The list of New Year honours included a very old friend of *The Gardeners' Chronicle*, Mr. James Watt, who acquired the business of Messrs. Little and Ballantyne, nurserymen and seedsmen, of Carlisle, so far back as 1870, and conducted it as the sole partner until quite recently, when he took his two sons into partnership. The knighthood conferred upon Mr. James Watt was in recognition of the many public services he has rendered; horticulturists generally will have learned with great pleasure that a member of their own profession and industry has been thus signally honoured. Sir James was born in East Lothian, in 1812, where his forbears were extensive farmers. He served his apprenticeship as a seedsman in Edinburgh, but his life work has been carried out with the firm of Little and Ballantyne. He is one of the oldest members

SIR JAMES WATT.

of the Royal Agricultural Society, and was at one time a successful breeder of Leicestershire sheep and pedigree shorthorns. In 1900, he served on the Board of Agriculture's Departmental Committee on Seeds; was Chairman of the English Forestry Committee in 1921; President of the Scottish Nursery and Seed Trades' Association in 1891, and he is one of the founders of the English Arboricultural Society. Sir James has always taken a great interest in local affairs, and is an Alderman of the Cumberland County Council, and hon. treasurer for the Conservative Organisation of that county. Fortunately, Sir James enjoys good health, and his many friends trust he will long be spared to continue to control the fortunes of the large nursery business he has done so much to place in the forefront of horticultural enterprises.

**Sugar Resources of the British Empire.**—On Tuesday, January 25, Mr. Ben. H. Morgan, Chairman of the British Empire Producers' Organisation, will lecture before the Royal Society of Arts on "The Sugar Resources of the British Empire." The lecture will commence at 4.30 p.m., and the Rt. Hon. L. C. M. S. Amery, M.P., Secretary of State for Dominion Affairs, will preside.

**The Nursery Trade in Berlin.**—The municipal authorities in Berlin have decided to grant short-term loans to nurserymen wishing to extend their businesses, on condition that production is definitely increased as a consequence. A credit of a quarter-of-a-million

gold marks is being established for the purpose of the loans, which will carry the moderate interest of six per cent. It is hoped by this means to assist German nurserymen to compete successfully with foreign growers, especially in the cultivation of Roses and Carnations; if it is found to have this effect, doubtless other large German towns will follow the example of the capital.

**Lecture on Marketing Fruit.**—At a meeting of the Farmers' Club, to be held at the Surveyors' Institution, 12, Great George Street, Westminster, on the 31st inst., Mr. H. V. Taylor, of the Ministry of Agriculture, will deliver an address on "Modern Methods of Marketing Fruit."

**Buddleia Forrestii and B. Fallowiana.**—Regarding the confusion between *Buddleia Forrestii* and *B. Fallowiana*, our correspondent, A. G. F., writes: "I have come to the conclusion that the plant which I described (see *Gard. Chron.*, Dec. 18., vol. LXXX, p. 489, Fig. 214) is *B. Fallowiana*, as Mr. Marquand suggests, though how the apparently widespread confusion has arisen, I cannot state for certain. I can only suggest that it originated with the collected seed, as plants raised from the several consignments of seed sent by Mr. G. Forrest are all apparently *B. Fallowiana*, i.e., the plant described erroneously by myself under the name of *B. Forrestii*. Mr. R. L. Harrow, of Edinburgh, has kindly furnished me with details of the distinguishing characters of the two species, while he also suggests that the figure in the *R.H.S. Journal* is also *B. Fallowiana* and not *B. Forrestii*. It seems to be my plant which Mr. Notcutt refers to as the *B. Forrestii* of commerce, probably all of which are of similar origin, therefore there must be a very considerable number of plants thus wrongly named throughout the country. According to Mr. Harrow, whose statement endorses that of Mr. Marquand, the plants are best distinguished when in bloom by the width of the corolla tube—*B. Forrestii* has a very wide tube compared with the length of the corolla, while *B. Fallowiana* has a very narrow tube. *B. Forrestii* is also apparently not of such erect habit as *B. Fallowiana*, while its foliage is considerably broader and has far less, in fact, very little, silvery down. From this information, I think there is little doubt as to the identity of the plant. I greatly regret having made an error as to the name, but trust that what must be a fairly widespread mistake, will now be rectified."

**International Rose Conference, July, 1928.**—An International Rose Conference will be held in London in the beginning of July, 1928. On the first day a Rose show will be held to give raisers of all countries the opportunity to exhibit their best productions and, if possible, demonstrate the steps which have led up to them. Awards of cups, medals and certificates will be made. The second and third days will be devoted to the Conference proper, and distinguished raisers and growers will be invited to submit papers on "The Genetics of the Rose," "Fungus and other Pests," "The Future of the Rose as a Decorative Flower," "The Future of the Rose as a Market Flower," "Roses under Glass," and "Rose Species." British (including Australian, New Zealand and Canadian), Continental and American experts will be invited to contribute to this programme. A dinner will be given on the first night and a conversatione on the second, while visits will be planned to Kew Gardens and also to several of the leading nurseries. A Reception Committee will be formed to assist visitors to secure hotel accommodation, etc. The time table proposed is as follows:—June 29 and 30: National Rose Society's Summer show; July 2: Visit to Kew; July 3: Visit to Colchester Nurseries; July 4: Conference, Rose Show and Dinner; July 5 and 6: Conference; July 6: Evening Soirée; July 7: Visit to Lea Valley Nurseries. Raisers in Australia, New Zealand, Canada or the United States desiring to have plants of special varieties grown in Britain to enable them to exhibit blooms of their novelties at the Conference, are requested to get into touch with nurserymen whom they may know, asking them to cultivate

the plants. A number of British growers have already promised to do so, and to treat the plants as if they were absolutely the property of the senders. Raisers who may not know nurserymen personally in this country are invited to write to Mr. Courtney Page, 28, Victoria Street, Westminster, London, the Secretary of the National Rose Society, who will make arrangements to have the varieties grown. Plants sent under this scheme would be taken every care of, and precautionary measures as far as possible assured.

**Transport of Flowers by Air.**—Some interesting facts on the development of air transport for flowers are given in our contemporary, *La Revue Horticole*, January 16. For several years past, fresh flowers have been carried regularly by aeroplane between Holland, Germany and Scandinavia; and in 1922 the Netherlands Dahlia Society sent to Paris by air a splendid collection of new varieties which were entered for the special competition organised by the French National Horticultural Society, and were afterwards distributed to the hospitals. The idea is being seriously considered of making use of air transport for the immense trade in fresh flowers which is done in the south of France and on the Italian Riviera. The utilisation of the air-line which has plied regularly since the summer of 1926 between Marseilles and Paris, forming a link with the air-lines from Paris to the towns of Northern Europe, would mean an appreciable saving of time without a great increase in cost, especially as the flowers would arrive fresher at their destination and there would therefore be less loss in transit than at present.

**Exchange Stabilisation in Hungary.**—Following the example of Germany and Austria, Hungary has altered the title of the coinage used, and the standard coin used is now known as the "Pengő," equal to one hundred Heller or Filler. The "Pengő" is worth about 9d. in English money.

**The Flora of New Zealand.**—Mr. Gerald Loder, President of the Royal English Arboricultural Society, and a member of the Council of the Royal Horticultural Society, has presented a Silver Challenge Cup (Fig. 33) to New Zealand with the object of encouraging the preservation and cultivation of the native flora of New Zealand. The Prime Minister of New Zealand, who recently left for the Dominion, is taking the cup with him. It is to be competed for at the principal shows, both in the North and South Islands, under conditions to be drawn up by competent authorities on the spot. The Government of New Zealand has from time to time set apart certain reserves, one aim of which is to preserve native trees and shrubs and flowers from extinction, the danger of which is increasing partly owing to clearances and partly owing to the rapid acclimatisation of alien introductions. In the public gardens, too, increasing efforts are being made in the same direction, and it is hoped, by the institution of some form of competition at public shows, to stimulate the cultivation of native plants in private gardens. The flora of New Zealand is not only of extreme interest to botanists on account of its long isolation and consequent distinctiveness, but, owing to similarity of climate, especially of the Southern Island with the Western and Southern parts of the British Isles, it is capable of furnishing British gardens with many more shrubs and flowers than is generally supposed. Something like one hundred species of Veronicas are to be found in New Zealand, nearly half of which are hardy enough to be grown in the open at Kew. Those who have been privileged to see Major Dorrien Smith's fine collection of New Zealand plants at Treco, in the Scilly Isles, formed partly by his predecessors, but largely by himself, will recognise how valuable many plants of the New Zealand flora are in gardens.

**Stellenbosch Botanic Gardens.**—The improvements in the botanic gardens at Stellenbosch, South Africa, which have been effected by the Curator, Mr. Herre, are proceeding apace. The biological section is especially admired by English and Dutch visitors alike; it is the first

establishment of the kind in South Africa, with its new porcelain name plates giving all necessary particulars of the specimens. Public interest has been considerably aroused by the developments which have taken place, and the authorities are now in a position to carry out a plan which they have long contemplated, that is, to move the nursery to a more favourable spot. Next year, under the direction of Mr. Herre, a modern greenhouse will be erected, and will be followed by other houses, including one specially adapted for tropical plants.

**Appointments for the Ensuing Week.**—**MONDAY, JANUARY 24:** National Chrysanthemum Society's Executive Committee meets.

the shoots grow four inches in length, they are pulled up, with roots attached, and planted in rows one foot apart and six inches distant in the row. If the head is cut off in planting, the lower eyes all grow and make a good crop the first year. Peppermint, like Couch-grass, sends up shoots at every joint, and after a couple of seasons or so the shoots get so crowded that they become weak, the leaves small and hard, the blossom poor. In this state it is not half so good for distillation. About Mitcham, however, much attention is paid to its after cultivation. They manure the ground the second year, and dig out furrows half a rod apart, throwing the mould over the beds. If new crops are wanted from these beds, plants

FIG. 32.—CYPRIPEDIUM CHARDWAR VAR. PERFECTION.

R.H.S. First-Class Certificate, January 11. Dorsal sepal white with spots in the central area; petals light greenish-yellow with brownish reticulation. Shown by G. F. Moore, Esq.

(see p. 56.)

**TUESDAY, JANUARY 25:** Royal Horticultural Society's Committees meet; British Carnation Society's annual meeting; Gardeners' Royal Benevolent Institution annual meeting and election at Simpson's Restaurant, Strand; Wimbledon Gardeners' Mutual Improvement Society's meeting. **THURSDAY, JANUARY 27:** Paisley Florists' Society's meeting. **FRIDAY, JANUARY 28:** Association of Economic Biologists meeting. **SATURDAY, JANUARY 29:** Lancaster and District Horticultural Society's lecture.

**"Gardeners' Chronicle" Seventy-five Years' Ago.**—*Peppermint.*—Peppermint is very largely grown round Mitcham; not less than three hundred acres are occupied with it for distillation, Peppermint water being much used in medicine. For new plantations the ground is dunged and ploughed by April, and as soon as

are selected for the purpose, as described above. The third year the Mint is all ploughed down in November, a judicious practice, when we consider the sort of plant we have to deal with. In this way the destruction of all weeds and seed weeds is effected, as well as the manuring of the land, if required. In spring the Mint comes up thick, strong and healthy, producing an enormous herbage and amount of flower. It is cut down when just going out of bloom, and carried to the drying houses; for the more its watery juices are evaporated the finer the extract is. It is not only extensively grown at Mitcham, but I am informed that in the adjoining parishes there are at least three hundred acres of Peppermint cultivated every year. Spearmint is not grown, as it does not yield much juice. *James Cuthill, Camberwell. Gard. Chron., January 24, 1852.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley, Park, Bletchley, Bucks.

**Cypripediums.**—The great demand for flowers of these easily-grown Orchids for all kinds of decorative work has caused them to be one of the principal features of present-day collections. Many of the cool-growing *Cypripediums* which have passed out of flower may be repotted so soon as possible whenever new roots are observed to be developing. Pot-bound specimens should be shifted into larger receptacles, which should be thoroughly well-drained. *Cypripediums* require a fair amount of pot room, and as the best flowers are obtained from good, strong plants it is desirable to hasten their development as fast as possible. Almost any kind of rich, porous soil is suitable as a rooting medium. The general practice is to prepare a mixture consisting of equal parts of good, fibrous loam, good English peat or A.I. fibre, broken up roughly, according to the size of the plants to be potted, with all the small earthy particles removed, and some Sphagnum-moss. The materials should be well mixed and made warm before being used. Newly-potted plants should be placed in the warmest part of the house until they become re-established, and water should be afforded them with great care.

**Dendrobiums.**—The flower buds of many of the deciduous and semi-deciduous varieties of *Dendrobium* are developing, and the roots may receive slightly more water, but the plants should be allowed to become dry before watering them again. Any check given to these plants during the development of their flowers, either from an excess or deficiency of water, or from too low, or too high, a temperature will show itself in the inferior size and quality of the flowers. It is not advisable to hasten their development unduly, as growth made in these short, dull days is always more or less of a weak nature. The flowering period may be prolonged by placing some of the more forward specimens in a more humid and warmer position, but this should not be attempted with choice and scarce varieties. At a later date, when the days are longer and the weather conditions more conducive to the plant's welfare they will make satisfactory growth and produce fine flowers. Plants which were slightly forced in previous years will respond readily to this treatment year after year without any harm accruing, hence the advisability of keeping the same plants for this particular purpose.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WYVERTREE, Horsley Hall, Gresford, N. Wales.

**Seakale, Chicory and Rhubarb.**—Adequate supplies of these vegetables should be brought into the forcing house at frequent intervals to maintain a succession. Do not use an excessive amount of fire-heat or the growth will become drawn and stringy; a temperature of 55° is suitable. Chicory should be grown at the cooler end of the house. Promote a moist atmosphere by damping the floors on frequent occasions.

**Early Peas.**—If seeds be sown now in pots or boxes, the latter for preference, and germinated in a temperature of about 45°, the young plants will be ready for planting out-of-doors towards the end of March. The most convenient-sized box for this purpose is one thirty inches long, five inches deep and five inches wide. The bottom of the box should not be nailed in, but fixed securely by strong string, so as to be detached easily at planting-out time. The soil for sowing the seeds should consist of three parts loam, and one part each of leaf-mould

and burnt earth. Sow the seeds about one-and-a-half inch apart, and cover them with about one inch of soil. So soon as the seedlings commence to grow, ventilate them freely to ensure sturdy and well-hardened plants that will not receive a check when planted outside. A few good varieties for this purpose are Harbinger, Eight Weeks, Little Marvel, Chelsea Gem and English Wonder. Mice are often very troublesome in eating the seeds, but not if the latter are coated with red lead before they are sown.

**Broad Beans.**—To ensure early pods the seeds should be sown now in four-and-a-half inch pots which will accommodate two plants that may easily be separated without giving them an undue check at planting-out time. The pots should be filled with soil of a loamy nature mixed with leaf-mould or manure from a very old hot-bed and a small quantity of burnt earth to render the soil porous. Germinate the seeds and grow the seedlings as advised for Peas.

**Seakale.**—If the requisite number of thongs has not already been prepared, the work should receive immediate attention. Choose straight pieces of roots and cut them into six-inch lengths, taking care to make the cut on the upper end straight across, and the lower end slanting. Tie the thongs in bundles of twenty-five, and either plunge them in boxes of sand or ashes, in a cold frame, or outside in similar material, covering them to a depth of about three inches to exclude frost. The object is to have the cuttings well callused before planting-out time arrives.

**Seed Potatoes.**—These should now be placed in boxes to sprout. Keep the tubers in a light, airy, frost-proof place, as much of the success with the Potato crop depends on the sets having sturdy shoots.

**Root Store.**—During bad weather look over all roots in store and remove any that are showing signs of decay.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Vineries.**—The vines in the early Muscat house may be started now. Maintain a temperature of 48° to 50°, and a moist atmosphere by sprinkling the walls and all bare spaces with water. The vines may be syringed twice a day in fine weather until the buds have broken freely. Where several laterals develop from the same spur, remove all the weakest shoots so soon as possible. Prune the vines in all the late houses so soon as the Grapes are cut, for nothing will be gained by leaving them on the vines after this date as they will keep as well, or better, in the Grape room, where a temperature of 43° to 45° is maintained. Examine the border, and water the soil if necessary. Wash all glass and woodwork and whitewash the walls with a mixture of hot lime and sulphur. Cleanse the rods with soft soap and sulphur; unless the vines are infested with mealy bug only strip off the loose bark. Remove the top soil down to the roots and then dust the surface with vine manure. Take away the old soil and substitute a mixture of fresh loam, lime rubble and burnt ash or charred soil. Should lime be absent in the soil this material should be scattered evenly over the border and lightly forked into it. When the vines have been pruned and cleansed keep the house dry and cool, as a perfect rest is of paramount importance to the vines.

**Pot Fruits.**—Those who are in a position to start a dozen or two pot trees of the earliest kinds of Peaches and Nectarines may defer closing the first Peach house until well after the turn of the year. Stone fruits of every kind do well in pots when judiciously managed under glass. Some kinds of fruits, as a matter of course, force better than others, but if properly prepared and treated on rational principles, all may be induced to yield ripe fruits long before the same varieties on open walls yield ripe crops. The chief requirements are to grow well-estab-

lished trees in light, well-ventilated houses furnished with sufficient fire-heat to keep out frosts. Experienced growers buy maiden trees, pot them and grow them on in the garden as reserve stock. Amateurs who have not this convenience need not despair, as any nurseryman who specialises in orchard house trees will supply him with perfect trees at reasonable prices. In selecting trees from the nursery choose those with moderate, short-jointed shoots, well-balanced heads and clean stocks, in nine-inch pots. Collections have given place to selections, and none but the very best sorts of their kind should have space under glass. The secret of success in forcing fruit trees is the avoidance of a high temperature and a close atmosphere when the weather is fine, also not to allow the thermometer to fall below 40° in severe weather. The trees should not be forced unduly, especially Plums, Cherries and Apricots, but this also applies in a slightly lesser degree to Apples and Pears.

**Cucumbers.**—Guard against overcropping the plants in bearing and keep a sharp watch for thrips. Allow the shoots to grow freely to promote root-action. Apply a top-dressing of loam mixed with a little leaf-mould or old Mushroom-bed manure when necessary, and see that the top-dressing is of the same temperature as the bed when it is applied. Keep the night temperature at 65° to 70°, and 75° to 80° by day, and have recourse to covering the glass with mats when cold winds and frosts prevail. Admit a little air daily when the weather is favourable for ventilating, and give the roots weak liquid manure when a stimulant is required. Make a fresh sowing to raise plants for spring supplies.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN  
Brockett Hall, Hertfordshire.

**Begonia Gloire de Sceaux.**—This *Begonia* is not grown nearly so extensively as it deserves to be. It is undoubtedly a fine plant when it is well-grown but, like most of the other *Begonias*, it will not thrive in a smoky and foggy atmosphere. The plants are coming into flower and where they have filled their receptacles with roots they should be fed liberally with liquid manure and never allowed to become dry at the roots, or the flowers will fall off before they open. The top ventilators should be kept closed in foggy weather.

**Stove House.**—The work of cleansing this house and sponging the plants in it should receive timely attention, for with the lengthening days other pressing work will be forthcoming and this house may be overlooked. All creepers should be taken down and washed, and where the shoots have become crowded they should be thinned carefully, leaving no more than are necessary to furnish the space available. Any plants that require repotting or top-dressing may be attended to. Wash all the old pots for this will help to sweeten the atmosphere considerably.

**Raising Plants from Seeds.**—Many varieties of flowers that will make a good display for the greenhouse may be raised from seeds, also others suitable for decorative purposes. Subjects that should be sown now include *Begonias*, *Gloxinias* and *Achimenes*, also such foliage plants as *Asparagus plumosus nanus*, *A. Sprengeri* and *Grevillea robusta*. The seed-pans should be well-drained and filled with a light, sandy compost made moderately firm, and the soil watered with a fine rose can sometime before sowing takes place. The seeds of these flowering plants are very minute and should be distributed carefully over the surface; they will not need covering with soil. The receptacles should then be placed in a brisk heat, covered with a piece of glass and shaded from bright sunshine until germination takes place. Watch carefully for the seedlings to appear, and so soon as they can be handled transfer them to pots filled with new soil. Success will depend on the treatment given to the seedlings in their early stages. They may be grown successfully by repotting

them on frequent occasions in sweet soil. Seeds of the foliage plants mentioned are sometimes a long time germinating, which may be hastened somewhat by soaking them for about twelve hours in water warmed to about 100°. These foliage plants are almost indispensable for decorative purposes and are very easily cultivated. The soil for raising the seeds may consist of equal parts peat and loam, with a liberal amount of coarse sand to render the compost porous. A brisk temperature is needed to raise these plants successfully. They may be increased by dividing the roots, but I prefer raising a batch from seeds each year.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

**Espalier Trees.**—Young trees that have not furnished the space available will need very careful attention. Cut back the central leader each year just above where the next pair of branches are required, allowing one bud to form the upright leader and one on each side for the side tiers. Prune the side-shoots forming the tiers to within fifteen inches at each pruning until they have reached their limit, and shorten all other shoots that are not required to within two or three buds from the base, to form fruit spurs. Ten or twelve inches will be ample space between the branches. Older trees which may have been neglected and become much crowded with old snags useless for the production of good, clean crops of fruits will need care and attention in the matter of thinning so as to encourage the development of plenty of sturdy fruit buds all along the branches. Heavy dressings of manure, including liquid stimulants, should be applied frequently to many of the older trees to develop strength and vigour in the buds. Those who intend to plant young Pear trees should not overlook the merits of *Nouvelle Fulvie*, *Duchess de Bordeaux* and *President Barabe*, which are three very useful Pears to follow November varieties.

**Labelling Trees.**—It is important to have all kinds of fruit trees labelled correctly; the labels should be re-written before they become illegible. There are many kinds of labels available of wood, zinc and lead. The last, stamped with the name, are the most durable. These should be secured loosely to the individual trees with copper wire so that the bark may have ample room to expand without being injured. It is advisable to keep a book of reference in which each tree should be numbered so that should any labels become worn out or lost the names may be replaced.

### THE FLOWER GARDEN.

By JOHN CUTTIS, Assistant Curator, Royal Botanic Gardens, Kew.

**Asters.**—Michaelmas Daisies may now be replanted; indeed, the strong-growing varieties should be replanted every year. Quite small portions of the plants should be selected, as three to four shoots are quite sufficient. If grown in this way and allowed plenty of room they should branch right down to the ground. Asters look best when grouped in large masses, and fit in especially well in the wilder parts of the garden, where the dressed part and wilder portions meet. Some of the varieties also are ideal for filling large beds on lawns. The variety *H. Adams* is very fine for furnishing a large bed, as it is very stiff and holds its shoots up well. *Aster Amellus* var. *King George* is seen at its best when filling a large lawn bed; there are, however, numerous other varieties suitable for this purpose.

**Herbaceous Borders.**—If not already done, advantage should be taken of fine weather to replant and rearrange the subjects in the herbaceous border. If it is necessary to replant entirely, it is unwise to clear too much of the border at once, as severe weather may intervene and delay the work. The plants removed should

be labelled carefully and placed in a convenient position for replanting, covering them in the meantime with mats or canvas. When clearing the border care should be taken not to remove plants that do not quickly recover from transplanting, such as *Paeonias* and *Gypsophila*. After clearing the border it should be trenched, working in plenty of farmyard manure, using cow dung on light, sandy soils, which are also improved by the addition of good loam. Before replanting, the ground should be trodden firmly, and a dressing of lime or basic slag forked into the surface. In replacing the plants where division is necessary the outside of the clumps should be selected, rejecting the worn-out centres. In arranging the plants it will give a more pleasing effect if some of the medium-sized sorts are brought well to the front and the taller ones brought forward into the middle of the border. Where possible, interplant early- and late-flowering plants. Where it is not necessary to replant the border, a dressing of bone-meal may be forked into the soil, at the

FIG. 33.—CUP PRESENTED BY MR. GERALD LODER FOR ENCOURAGING THE PRESERVATION AND CULTIVATION OF THE NATIVE PLANTS OF NEW ZEALAND.

(see p. 61).

same time lifting and dividing some of the stronger-growing subjects, such as *Heleniums* and perennial *Asters*.

### Herbaceous Plants for Large Lawn Beds.

There are numbers of plants suitable for this purpose, and it is surprising they are not more generally used. They include *Salvia nemorosa*, generally known as *S. virgata*, which is, however, a very inferior plant; *Salvia uliginosa*, which is not very hardy except on dry, warm soils; *Achillea filipendulina*, *Heleniums*, such as *H. Riverton Beauty* and *Riverton Gem*, *H. autumnale pumilum*, *H. Crimson Beauty*, *Bocconia cordata*, *Anchusa italica* var. *Dropmore* and *Pride of Dover*, both of which succeed best when raised each year from root-cuttings. Some of the choice *Asters*, *Phloxes* and *Paeonias* are also suitable for this purpose. They may be interplanted with *Narcissi*, which are beautiful when in flower with the young, brightly-coloured shoots of the *Paeonias*. A late display may also be obtained by interplanting with *Gladiolus* or *Hyacinthus candicans*. *Acanthus mollis* is also very effective in lawn beds, especially where a foliage effect is desired. *Eryngium planum*, which is best raised from seeds each

year, is suitable, also the biennial *E. giganteum*; if *E. planum* is interplanted with *Campanula persicifolia*, a prolonged display is secured. There are many fine varieties of *Campanula persicifolia* and they make very effective lawn beds. *Hollyhocks*, raised annually from seeds are, in certain situations, very effective for the purpose, as also are *Delphiniums*. *Cimicifuga simplex*, a beautiful, late-flowering plant, is also very beautiful in a moist, partially shaded situation.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Hot-beds.**—Where plentiful supplies of stable litter and fresh leaves are obtainable hot-beds form the most economical means of supplying a steady bottom-heat for the production of early supplies of vegetables. The materials should be mixed thoroughly and made into a large heap. After fermentation sets in, the heap should be turned again to bring the heated parts to the outside of the new heap so that the mass may be of as uniform a temperature as possible. When it is evident on examination that the temperature of the heap has again reached a high degree, the hot-bed should be formed. The size of the bed should be determined by the size of the portable frames employed, but it is advisable to allow not less than three feet extra all around the frame or frames, and a depth of from three to four feet of the fermenting materials. When the frames are in position, a fair amount of good soil should be placed in them, and the whole allowed to settle for a week or so before planting or sowing the crops.

**Tomatoes.**—Plants intended for early cropping, which have been wintered on shelves in small pots, should now be transferred to larger pots. Use a compost of light texture and pot firmly. After repotting them the plants may be grown in full exposure to light in a warmer house for a week or two to encourage root-action, which at this season of the year is very slow. Seeds may be sown to raise plants for successional cropping, but it is advisable to defer the main sowing until February. Many Tomato plants are spoiled in the seed-pan through sowing the seeds far too thickly; the seedlings should not be less than one inch apart.

**Hippeastrums.**—Plants which have been resting since last September should now be ready for starting again in order to produce early flowers. The soil should be well-soaked with tepid water before placing the plants in their growing quarters, and so soon as the flower spikes or tips of the leaves are seen they should receive a top-dressing of good soil. The repotting of *Hippeastrums* is best done immediately after they have passed out of flower, as then they have plenty of time to fill their new pots with roots, which is necessary if the best results are to be obtained. Frequent applications of liquid manure during the growing season, which extends from March to September, will enable the plants to produce a fine display of flowers while growing in pots of a moderate size.

**Cypripedium insigne.**—This Orchid will produce a crop of flowers from November to February with the minimum of attention; the ease with which the flowers are produced, added to the longevity of the plants and the considerable time the flowers remain fresh when cut, make *Cypripediums* exceedingly valuable during the winter. *Cypripedium insigne* and its varieties are readily increased by division, and undoubtedly young plants develop very much finer flowers on longer footstalks, but the older plants, if fed generously with diluted liquid manure during the summer are capable of producing large numbers of flowers. Any dividing of the plants that may be decided on is best performed immediately after the flowers have faded, and where any of the pots or pans allow, a liberal top-dressing of fibrous turf, rough leaves and *Sphagnum*-moss should be pressed firmly over the exposed roots, this top-dressing being, in many cases, preferable to placing the plants in larger receptacles.

## NOTES FROM WISLEY.

Among other successful alterations which have recently been carried out at Wisley is the formation of a new Fernery. It has been made on the banks of the ditch which divides the field garden from the Pinetum, and which was previously overgrown with trees and Brambles. The latter have been removed and a complete clearing has been made save for one shapely Alder. Most of the Ferns which occupied the old Fernery in the wild garden have been transplanted to these new quarters. An exception, however, is a group of *Lomaria boryana* (syn. *magellanica*) whose large, evergreen fronds are particularly welcome at this time of year.

On the rock bank in front of the laboratory *Erica darleyensis* is in bloom. Although only a single plant it already covers an area of about forty square feet. In addition to flowers, a variety of colour is provided on this bank by the brilliant red rosettes of *Saxifraga cuneifolia* var. *subintegra*, by the Beet-like foliage of *Ajuga reptans purpurea*, the red-brown leaves of *Polygonum affine*, and by grey-foliaged subjects, such as *Stachys lanata* and silvery *Cerastium*, while light green Mosses are now conspicuous against the brown stones. The foliage of *Saxifraga afghanica* and *S. Beesia* is also ornamental and makes an effective winter edging to the sides of the path down to the field garden.

Among the shrubs *Hamamelis mollis* is already putting forth from its branches a few yellow threads. Although a deciduous plant, it has this year retained large numbers of its old and withered leaves. In the new borders several pale pink flowers are visible on *Prunus subhirtella* var. *autumnalis*, which begins to bloom in October and continues the flower spasmodically throughout the winter until the end of April. A peculiar feature of this plant which has been noted by Wilson is that on some individuals the leaves and flowers unfold in the spring at the same time, and the peduncle is then much elongated. Such individuals look entirely different to the plant in its normal state, and whether the flowers open before or at the same time as the leaves is not fixed but may vary on the same individual from year to year.

In the same borders *Sycopsis sinensis* is in bloom. The yellow, staminate flowers are in heads surrounded by brown, hairy bracts, but they are so small that they may easily pass unnoticed. The best feature of this shrub is its evergreen foliage. Another handsome evergreen is *Arbutus hybrida*, of which the drooping panicles of white bloom are just beginning to show. It is intermediate in character between *Arbutus Andrachne* and *A. Unedo*. A small tree of the latter is to be found in the garden, but the situation and climate do not favour the production of its Strawberry-like fruits. There is also a fairly large tree of *Arbutus Menziesii* in the wild garden, which is now attractive on account of its bright red bark.

Other trees which are exceptionally conspicuous in this respect are the Birches, of which several different varieties are planted near the field garden pond. One of the most handsome is *Betula nigra*, the Red or River Birch. Its bark ranges in colour from silver-grey to red-brown, and usually presents a torn and ragged appearance. Another attractive variety is *Betula kenaica* (Koehnei?), the stems of which are orange and covered with white bloom. In addition to the common Silver Birch, of which there are many in the wild garden wood, there is a specimen of a weeping variety of the latter, *Betula verrucosa pendula* Youngii. Its stem is only visible when the leaves have fallen, since the surrounding branches extend right down to the ground and effectually hide it.

In the new alpine house *Saxifragas*, such as *Saxifraga lilacina*, *S. Irvingii*, *S. apiculata* and its white variety *alba*, are in bloom in company with hybrid *Primroses*. *Auriculas* and *Primula megasacfolia*. The last is also in bloom in the open, where its large, round leaves are much bigger and tougher than those in the alpine house. It occurs naturally on the mountains of Asia Minor. J. E. Grant-White.

## NOTES FROM EDINBURGH.

COMPARATIVELY open weather has been experienced here this winter, with the exception of a few showers of sleet and a slight fall of snow. These climatic conditions, from the gardener's point of view, are to be regretted, but on the other hand they have been the means of giving a few plants the opportunity of flowering much earlier than they otherwise would have done had frost held them in check. In many instances growth has started, and the spring-like appearance of shoots and leaves may be checked before the present month is out.

There is nothing more beautiful and natural in a garden than a group of *Primula* Winter peeping out from their shelter among the snow. This captivating Winter *Primula* is, to say the least, a gem. Its purple or blue rosette of flowers is surrounded by yellow-mealy foliage, and the stems, although short, give the flowers just sufficient support to show their beauty. It is of a dwarf habit and should be planted six to eight inches apart to allow for growth expansion. In the rock garden it grows on a ledge in the shelter of a sand-stone boulder partially shaded by a clump of *Rhododendron rigidum*. Rosettes of from twenty-five to thirty flowers are at present in full bloom. Where conditions tend to excessive moisture, sheets of glass may be used for protection in winter, and no pains should be spared to pollenate a few flowers to ensure a sufficient quantity of seeds for future use. It is a native of the Himalayas and is to be commended to lovers of the genus.

Other members of the same family, though common but more appreciated at this time of the year, are *P. officinalis* and *P. vulgaris*. They are to be seen by the banks of the pond and in sheltered parts of the wild and rock gardens.

Far removed from its flowering season,

a good specimen of *Meconopsis integrifolia* var. *brevistyla* has dared the winter and produced a large, yellow flower on an undeveloped spike which gives signs of producing more. It is difficult to give the reason for this premature flowering, but it may be that the plant is making up lost time, or it may be a trick of nature. So far, few have met with success in flowering this beautiful *Meconopsis* in gardens.

Christmas Roses are among the winter-flowering subjects, and give of their best in sheltered quarters. *Helleborus niger* is too well-known to need comment. *H. viridis* with its green flowers may be considered beautiful when few flowers are available to pick and choose from.

Representatives of *Saxifraga Burseriana* hold out hopes of making a good display later. At present two forms, minor and magna, have numerous open flowers, and although the slight covering of snow has hid the plants from view, they will come up smiling and refreshed when the thaw sets them free. These members of the *Saxifraga* family are compact, beautiful plants, and may be grown by any one with excellent results.

Growing in a sheltered part of the border, *Colchicum syriacum* has brightened the surrounding dullness by producing some very fine, pink flowers. Annually flowering in December or January, it is a most attractive bulbous plant.

*Gentiana rigescens*, a native of China, has a long flowering season in winter, and it may be counted on producing flowers from November to January. The long stems of pale blue flowers are most useful for cutting, and the plant fills up an otherwise flowerless period. It is of easy cultivation by division. Seed is difficult to obtain in view of the time the plant is in flower.

Perhaps more attention ought to be paid to the Snowdrop, *Galanthus nivalis* and its varieties but no description seems necessary, as every one is familiar with these harbingers of spring. Alex. McCutcheon.

### KNAP HILL NURSERY WOKING, SURREY (Late Anthony Waterer)

The Executors of the late  
**HOSEA WATERER**  
have pleasure in offering

### HARDY RHODODENDRONS

For general purposes  
Without doubt the finest stock in the trade  
of named varieties, 2 to 6 and 8 ft.

AZALEAS in great variety, 2 to 5 ft.

HARDY HEATHS, in variety

### GOLDEN YEWS

A Magnificent Stock in all shapes and  
sizes from 2 to 10 ft.

PRIVET, common and oval-leaved.

QUICK and HORNBEAM, for Hedges,

### STANDARD TREES

in great variety, consisting of

LIMES, NORWAY MAPLES, ELMS, Etc. Etc.

EVERGREEN &amp; DECIDUOUS SHRUBS, viz.

Box, green and variegated, 3 to 8 ft.

Hollies, Common, 5 to 8 ft.

" Variegated and green

varieties, 2 to 6 ft.

Thuopsis borealis, 10 to 12 ft.

Cupressus Lawsoniana, 12 to 14 ft.

Cedrus atlantica glauca, very fine, 14 to 16 ft.

Osmanthus, Phillyrocas, Spirocas, Lilacs,

Viburnums.

and a good general nursery stock.

Catalogues ready.

Inspection invited when it will be found  
well worth a visit.

### COOPER'S WINTER SPRAY FLUID

EXTERMINATES INSECT PESTS.  
KILLS MOSS, LICHEN AND  
OTHER GREEN GROWTHS  
REMOVES ROUGH LOOSE BARK  
REINVIGORATES THE TREES

("Commended" by the Royal Horticultural Society  
of Great Britain.)

## PLANTS IN FLOWER AT LA MORTOLA ON JANUARY 1, 1927.

THE following list of plants in flower at La Mortola on January 1, 1927, enumerates only 265 as against 401 in 1906. The list was forwarded by Mr. S. W. McLeod Braggins.

*Abelia chinensis*, *Abutilon Darwinii*, *A. hybridum*, *A. insigne*, *A. striatum*, *Acacia Baileyana*, *A. decurrens*, *A. Hanburyana*, *A. microbotrya*, *A. nerifolia*, *A. podalyriaefolia*, *A. retinodes*, *Agatheae coelestis*, *A. hispida*, *Agave Katherinae*, *A. Karwinskii*, *Ageratum mexicanum*, *Albizia lophantha*, *Aloe affinis*, *A. arborescens natalensis*, *A. ciliaris*, *A. longiflora*, *A. Pienardii*, *A. rubrolutea*, *A. speciosa*, *A. supralavis*, *Alyssum maritimum*, *Andropogon hirtus*, *Anemone coronaria*, *Antholyza aethiopica*, *A. paniculata*, *Antirrhinum majus*, *Aponogeton distachyum*, *Arbutus Unedo*, *Arum Arisarum*, *Asparagus aphyllus* and *Azalea indica*.

*Begonia miniata*, *B. macrophylla*, *B. Rex*, *B. semperflorens*, *Bellis sylvestris*, *B. perennis* fl. pl., *Bergenia crassifolia*, *Bignonia australis*, *B. venusta*, *Borago officinalis*, *Bougainvillea glabra*, *B. Sanderiana*, *B. spectabilis*, *Bryophyllum crenatum*, *Bouvardia coccineum*, *Buddleia asiatica*, *B. auriculata*, *B. madagascariensis* and *B. officinalis*.

*Calendula officinalis*, *Camellia japonica*, *Campanula Trachelium*, *Canarina Campanula*, *Carica Papaya*, *Cassia artemisioides*, *C. tomentosa*, *Casuarina torulosa*, *Catha edulis*, *Ceanothus azureus*, *Cephalotaxus drupacea*, *Cestrum aurantiacum*, *C. lanatum*, *C. Parqui*, *C. suberosum*, *Cheiranthus Cheiri*, *Chimonanthus fragrans*, *Chlorophytum elatum*, *Chrysanthemum frutescens*, *Cocos Romanzoffiana*, *Cineraria stellata*, *Citrus Aurantium*, *C. Medica*, *Clematis cirrhosa*, *Clerodendron ugandense*, *Colletia cruciata*, *C. spinosa*, *Correa Lawrenceana*, *Coronilla glauca*, *Cotyledon macranthum*, *C. orbiculare*, *Crassula congesta*, *C. lactea*, *Crotolaria capense*, *Cyclamen persicum* and *Cyperus alternifolius*.

*Datura chlorantha*, *Dimorphotheca aurantiaca*, *D. Ecklonia*, *Dianthus arboreus*, *Diplopappus filifolius*, *Dodonaea Thunbergiana* and *Duvernoya adhatodoides*.

*Echeveria multicaulis*, *E. pachyphytioides*, *Elaeagnus pungens reflexa*, *E. macrophylla*, *Ephedra altissima*, *Eriobotrya japonica*, *Eriocephalus africanus*, *Eucalyptus coriacea*, *E. crebra*, *E. glabrata*, *E. Globulus*, *E. sideroxylon*, *Eupatorium grandiflorum*, *E. micranthum*, *E. album*, *Euphorbia grandicornis*, *E. triangularis* and *Euryops spathaceus*.

*Freylinia oppositifolia*, *Fuchsia aborescens*, *F. hybrida* and *F. triphylla*.

*Gasteria acinacifolia*, *Gerbera hybrida*, *Globularia Alypum*, *Grevillea Thelemanniana* and *Gynierum argenteum*.

*Hakea cristata*, *H. laurina*, *H. scoparia*, *H. suaveolens*, *Halleria lucida*, *Hedera canariensis*, *H. Helix*, *Hardenbergia monophylla*, *H. m. rosea*, *Heliotropium peruvianum*, *H. hybridum*, *Helleborus hybridum*, *H. foetidum*, *Hexacentris coccinea* and *Hibiscus macrantha*.

*Iberis semperflorens*, *I. sempervirens*, *Iochroma lanceolata*, *Iris unguicularis* and *I. u. alba*. *Jacobinia pauciflora*, *J. Penrhosiensis*, *Jasminum nudiflora*, *J. primulinum* and *Juniperus Oxycedrus*.

*Kalanchoe Dyeri*, *K. somaliensis*, *K. thyrsiflora*, *Kleinia madrasica* and *K. nerifolia*.

*Lantana Camara*, *L. nivea*, *Lathyrus sativus*, *Laurus nobilis*, *Linaria bipartita*, *Lavandula abrotanoides*, *L. dentata*, *Leptodermis lanceolata*, *Lonicera Standishii* and *Lopezia miniata*.

*Malcomia maritima*, *Malvaviscus mollis*, *Mesembryanthemum aequilaterale*, *M. elegans*, *M. linguiforme*, *M. molle*, *M. tigrinum*, *Montanoa bipinnatifida*, *M. tomentosa*, *Monstera deliciosa*, *Moricandia arvensis*, *Muehlenbeckia Cunninghamiana* and *Musa Ensete*.

*Narcissus canariensis*, *N. Tazetta aureus*, *N. T. polyanthus* and *Nicotiana glauca*.

*Osmanthus Aquifolium*, *O. fragrans*, *Othonna triplinervia*, *Oxalis cernua* and *O. purpurea*.

*Passiflora capsularis*, *Pelargonium lateripes*, *P. peltatum*, *P. zonale*, *Phyllica rosmarinifolia*, *Pilocarpus pennatifolius*, *Pithecotenium buccinatorium*, *Plumbago capensis*, *Poinsettia*

*pulcherrima*, *Polygala myrtifolia*, *P. apopetala*, *Primula kewensis*, *P. malacoides*, *P. obconica*, *P. sinensis*, *P. stellata* and *Pyrus spectabilis*.

*Raphiolepis indica*, *Reinwardtia trigyna*, *Reseda Phyteuma*, *Rhipsalis Casaytha*, *Rhus integrifolia*, *Rosa Bourbonica*, *R. indica*, *R. i. major*, *R. i. semperflorens*, *R. multiflora nana*, *R. sinica anemoneiflora*, *R. Thea Safrano*, *Rosmarinus officinalis*, *R. humilis*, *Ruscus Hypoglossum*, *Ruscus Hypophyllum* and *Russelia juncea*.

*Salvia cacaliaefolia*, *S. chamaedryoides*, *S. gesneraeiflora*, *S. amarissima*, *S. Heeri*, *S. involucrata*, *S. leucantha*, *S. leonoroides*, *S. semiatrata*, *S. Sessei*, *Schinus Molle*, *Sarcococca pruniflora*, *Sempervivum arboreum*, *S. holochrysum*, *Senecio angulatus*, *S. grandiflorus*, *S. longifolius*, *Sida mollis*, *Solanum Hartwegii*, *S. jasminoides*, *S. nigrum*, *S. Pantonnettii*, *Sphaeralcea umbellata*, *Statice brassicaefolia*, *Stenolobium stans*, *Syringa vulgaris* and *S. persica*.

*Tagetes lacera*, *Tecomaria capensis*, *Templetonia retusa*, *Tetrapanax papyriferum* and *Tropaeolum majus*.

*Ulex europaea*.

*Verbena officinalis*, *Veronica Andersonii*, *V. salicifolia*, *Vinca major*, *V. media*, *Viola odorata*, *V. cornuta*, *Visnea Mocanera*, *Vittadinia triloba*.

*Westringia rosmariniformis*.

shaped segments about three-quarters-of-an-inch in length and an eighth-of-an-inch in width, rounded at the tip and narrowing towards the base; they vary in colour from waxy white to a beautiful pale blue.

The six large, bright yellow anthers are borne on white filaments three-quarters-of-an-inch in length. The blossoms, when fully expanded, are over one-and-a-quarter-inch in diameter and last in perfection a considerable time.

*Herpolirion Novae-Zelandiae* blossoms in September and October and may be given a damp or boggy spot in the rock garden, in a compost of peat and sand, in a position fully exposed to the sun; it lends itself to increase by division which may take place just before the leafy growth commences. Some protection from damp should be given in winter as the plant is covered with snow during the winter of its native countries.

A. W. D.

## BOG GARDEN.

### USEFUL PLANTS FOR MOIST PLACES.

THE beauty and interest of a water garden is greatly enhanced by a well-kept grass bank in which may be planted at intervals of a few feet such bog and moisture-loving plants as

FIG. 34.—HERPOLIRION NOVAE-ZELANDIAE.

## ALPINE GARDEN.

### HERPOLIRION NOVAE-ZELANDIAE.

THIS exquisite little alpine plant (Fig. 34) is a member of the Natural Order Liliaceae; it forms large patches of verdure on the brinks of pools and other moist places in the Baw Baw Mountains of Victoria, at various elevations up to 4,500 feet, and on the summit of the western mountains and Hampshire Hills of Tasmania; it is also found in swampy places on the Southern Alps of New Zealand at sufficiently high altitudes to ensure its complete hardiness in the south of England.

The plant forms turves of spreading, grassy growths from two to three inches tall; the under-ground portion consists of numerous branched, creeping stems from which many fairly stout, fibrous roots spring. The foliage rises from nodes on the creeping stems; it is tufted, and consists of from three to six narrow, sharply pointed linear leaves from one to three inches in length; they are of a glaucous green colour and deeply grooved.

The pretty blossoms are solitary and borne on very short stems, clothed with a few narrow, sheathing bracts; they nestle in the centres of the tufts of leaves. The perianth is divided almost to its base into six strap-

*Senecio clivorum*, two feet; *Iris aurea*, four feet; *I. Monspur*, four feet; *I. Shelford Giant*, five to six feet; *I. orientalis*, four to five feet; *I. Kaempferi*, in many shades of beautiful colours, three feet; *I. pseudacorus* in yellow and white, four to five feet; *Lythrum Rose Queen*, four feet; *Astilbe Arendsii* in variety and *A. Davidii*; *Spiraea Aruncus*; *S. venusta*; *S. gigantea*, from three to six feet, a very effective plant; *Trollius* in variety; *Mimulus* in variety; *Saxifraga peltata* with large, bronzy, peltate leaves and corymbs of white flowers, a very showy water-side plant; *Rodgersia podophylla*, a handsome foliage plant, the large, peltate leaves on stout stalks, three feet high, assuming a coppery bronze colour with age; *Gunnera manicata* and *G. scabra*, both handsome plants with gigantic leaves on stout stalks; *Primulas* in variety, also the Royal Fern, *Osmunda regalis*, in variety, and *Lastrea Thelypteris*, both pretty waterside Ferns.

Many may venture on the hardy *Cypripedium Calceolus*, *C. pubescens* and *C. macranthum*, also hardy species of *Orchis* and *Habenaria* for the more shady parts; these Orchids grow splendidly in damp moss and sand.

There is an abundance of grass-like plants and Reeds which are indispensable for the bog garden and waterside planting. They give tropical effect to the surroundings, especially the taller Bamboos, which do well when planted in positions sheltered from high winds. W. L.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## LILIES IN 1926.

**M**ETEOROLOGICALLY 1926 will go down as a year of many records, in which a mild February, dry and sunny March and excessive November rainfall figure prominently, but though the prolonged fine weather of August and September brought out all that is best of the small late-flowering group, there was nothing, so far as Lilies were concerned, except a serious want of sunshine, to distinguish 1926 from other mediocre years.

In the home counties June and July are the months when the early and mid-season species make their display, and if the weather is against them then, there can be no recovery, as with garden Roses, in a fine autumn. At such times gardeners must acquiesce in a condition of affairs they can neither alter nor control, and fall back on the mainstay of all who cultivate a garden for pleasure or profit—the anticipation of a better time next year.

Except for an unusual period of cold weather before Christmas and a brief but severe spell in mid-January, the winter of 1925-1926 followed a course to which many more or less similar seasons have accustomed us, and one more year passed without the great frost of the century. A February dull but soft beyond all records spurred Lilies on, and when the wind blew in from the east half-way through March, precocious growth paid the usual and almost inevitable penalty. Watching some more or less exposed plants of *L. Hansonii* on March 23, when the wind blew with razor-like keenness against which no amount of clothing seemed proof, one could see the leaf-edges of this Lily curling over and changing colour as if seared by a hot iron; and though not then so forward as *L. Hansonii*, the foliage of a group of *L. regale* in an open border was served in the same cruel fashion, for all that the exposed thermometer gave no indication of exceptional cold.

Towards the end of March, after an exceptionally dry time, an interval of warm, sunny weather with welcome showers brought plant life on with a rush; it was a short-lived rush, however, for the wind soon backed into the east again and remained in that vicious quarter throughout April. Day after day of early May passed without relief, and when, on the 16th of

the month, a snowstorm raged on the Cotswolds and the Chiltern Hills, it seemed that the gardener's cup of misery was full. A pleasant spell of genial weather at Whitsuntide proved only a flash-in-the-pan, and June was more remarkable for consistently un-June-like weather than for anything else. Ground frosts at midsummer are no novelty to these annual chronicles, but a series of five on consecutive nights is happily rare.

Except for a welcome burst of real summer in the second week of July, that month was as dull and frigid as June, and with the best of the garden year gone, it seemed as if 1926 would

that the gardener has to search for blooms of *Iris unguicularis* at the present time when he would expect the plant to be in profuse and precocious flower as a result of the roasting autumn weather, seems to show once more that theory and practice do not invariably agree. The November rains may provide an explanation.

As already explained, the fine autumn retrieved the Lily season from absolute failure, but that does not necessarily imply that the June and July flowering Lilies failed in all southern gardens. Weather conditions vary widely even in areas adjacent to each other, and it is possible that even *L. candidum*, which was generally a failure, may have been the reverse in some places. But the cold and comparatively sunless months of April, May, June and July favoured that scourge of English gardens—*Botrytis cinerea*—and it was rampant. For a plant disease which seems to have been unknown or, at any rate, unrecognised in Britain much before the 'eighties, *Botrytis* has made astonishing headway, and though there must be many gardeners who can recall the initial attack on their own Lilies, there can be few others whose gardens are still exempt.

At this time of day it would doubtless be impossible to determine the country of origin of *Botrytis*, but while the disease may not yet be universal, it is certainly widespread; indeed, it is one of the plant diseases which towards the end of last century put an end for the time being to the commercial cultivation of *L. longiflorum* in Bermuda. It would be unfair to saddle the United States of America with the introduction of *Botrytis* to this country, but the disease seems to have been noticed there some time before it was recognised in Britain. Lilies are but one of the many genera subject to attack by this foul fungus, which may be seen on Lettuces, Tulips, Paeonies, Trillium, Erythronium, Narcissus and many other subjects; it has been observed, too, on the leaves of Gooseberries and Currants.\*

Happily, the display of the late-flowering Lilies last year furnishes a less depressing topic than the all too prevalent disease referred to, for without exception they were in better form than they have been for some years. Even *L. speciosum* was able to unfurl its buds untouched by frost—an occurrence sufficiently rare to be noted. *L. sulphureum* of Baker, too, and *L. Sargentiae*, excelled themselves, though each is so dependent on a warm autumn as to be beyond the patience of the majority of gardeners who have no greenhouse. *L. sulphureum* has a serious rival now in the Lily re-introduced by Farrer from southern Kansu, and named *L. centifolium* (Stapf). For a plant which is usually prolific of seed, this fine Lily is slow to find its way about, but it seems generally to have a stronger constitution than any of the taller-growing Lilies of the Eulirion group with large, long trumpets, and so far seems able to adapt itself to widely different conditions—a great point in a Lily. At any rate, the writer knows of specimens flourishing on the Bagshot sand, on strongly calcareous soil, on stiff ground over clay, and on sandy loam. Other Lilies of the same general type will not suffer our winter rains, which cause the resting bulb to decay; but Farrer's Lily has been fairly well tried in this respect during the past few years and has emerged with credit. Its future behaviour will be watched with interest, for at present there is no Lily at all like it which can be regarded as perennial.

*L. auratum* usually grows to better effect on the west side of the country than elsewhere, but it was exceptionally good in the south last autumn, for there was neither rain nor frost to spoil the flowers. The broad-leaved form, *L. a. var. platyphyllum*, again showed its superiority over the type, just as the robust, upstanding form of *L. speciosum*, called *magnificum*, leaves other coloured forms far behind. Amateurs who have not grown either would be well advised to discard all others in favour of the two varieties named, bearing in mind that both are intolerant of lime.

\* Gard. Chron., November 27, 1926, p. 434.

FIG. 35.—*LILIUM OCHRACEUM* (WILS.)  
Photographed in the Duke of Bedford's garden at Endsleigh in 1925.

have to be bracketed with 1922 as a black year. Fortunately, this was not to be, for August brought the much-needed relief and, incidentally, an excessive, almost West African humidity of the atmosphere, which prevailed from the last week of the month till the middle of September, and made the lack of rain less noticeable. An unusually fine October furnished a happy ending to as enjoyable an autumn as anyone could wish for, and if the record was subsequently washed out by the floods of November, the beneficent effect of the autumn should be apparent before long. The fact, however,

Supplement to the GARDENERS' CHRONICLE.

CORSICAN PINES (PINUS LARICIO VAR. PALLASIANA).

Another Lily which enjoyed the autumn of 1926, but seldom has a chance to develop its flowers before they are nipped by frost is the plant so often confused with *L. nepalense*, but now referred by E. H. Wilson to *L. ochraceum*, illustrated in Fig. 35, reproduced from a photograph of a plant grown by Mr. R. F. Fitt, gardener to the Duke of Bedford, at Endsleigh. Some forms of this species raised from seed collected by Forrest and Farrer may possibly prove happier in our climate than other forms, which have been tried out-of-doors again and again, but there seems little doubt that except, perhaps, in maritime gardens in the south and west this Lily, as well as *L. sulphureum* and *L. neilgherrense* are rightly regarded as greenhouse subjects. It is only necessary to see them growing under shelter to realise the truth of this. It is

garden by Lady Dartmouth in 1910 hundreds of self-sown plants annually push up their stems through wild and matted undergrowth on the borders of a stream, very much, in fact, as they grow in California. To those who realise how seldom anything of the kind has been achieved in England, this colony of the Panther Lily is at once an inspiring sight and an object lesson.

Under the conditions usually obtaining in gardens, Lilies planted in borders seldom have much chance to colonise the ground by seedlings. If left alone they drop their seeds and in favourable years a proportion germinates; but between the traffic inevitable to the upkeep of herbaceous borders and the annual "forking over" of the top soil beloved of working gardeners, very few seedlings survive the yearling

by so many plants of overtaxing its strength in flower and fruit. Wild plants of *L. tenuifolium* usually bear from two to four flowers on stems about twenty inches high, and the photograph (Fig. 37), kindly furnished by the Regius Keeper, of a fine specimen in the Royal Botanic Garden at Edinburgh shows of what the species is capable under cultivation. It is unlikely, however, that the bulb of the particular specimen illustrated survived the effort required to produce the effect shown in the photograph. In such cases of exuberant growth, removal of incipient seed vessels has sometimes been found to relieve the drain on the bulb of naturally short-lived species.

During the year a novel and interesting step, which may have far-reaching results for growers of Lilies, has been taken by Mr.

FIG. 36.—LILIUM LONGIFLORUM EXIMIUM AS A FIELD CROP IN BERMUDA

possible that the same may have to be said of the Formosan variety of *L. philippinense*, though it appears to be holding its own tolerably well in a few favoured places. Unfortunately, with this Lily as with many others, high cultivation seems to bring retribution in its train, for the effort necessary to support a stem five feet high with five or six flowers and as many capsules of seed is often more than the naturally small bulb can bear, with the result that it dies. Happily, however, there is usually an ample measure of seed from which fresh bulbs can be quickly and easily raised.

*L. pardalinum* usually bridges the interval between the late summer and early autumn flowering Lilies, and though the inclement weather of mid-July delayed the opening of the flowers, they responded directly the weather changed. A good example of the successful colonisation of this species on broad, natural lines is to be found in the park at Patahull, where from a few bulbs transferred from the

stage. Anyone who has seen for himself the harvest of often really precious seedlings of various plants which may be garnered from a border not systematically stirred by the fork, must have wondered whether an operation not thought necessary by Nature is not sometimes overdone by man.

An interesting little Lily, *L. cernuum*, which has been in the hands of one or two amateurs since bulbs were first sent to England in 1914 by M. Kesselring, of Petrograd, made a public re-appearance last year, Messrs. R. Wallace and Co., of Tunbridge Wells, having received an importation. Except in the colour of the petals and the fragrance of the flowers there is not much from the horticultural or cultural point of view between this Lily and *L. tenuifolium*; but each is well worth growing. It is not yet possible to say whether *L. cernuum* has the comparatively short life usually associated with *L. tenuifolium*, which, under high cultivation, exhibits that fatal facility possessed

Amos Perry, of Enfield, who has arranged for the importation of Lily bulbs grown in New Zealand. As is well-known by those interested in the cultivation of Lilies, bulbs imported from Japan and America usually reach the hands of growers between November and February, to be planted out in gardens at a time when the ground is wet and cold, in the worst possible condition, in fact. No one can say how many of these dormant bulbs ever reach maturity, but experience shows that the proportion is small. To reduce these losses and bring the bulbs to maturity expeditiously and in comparative safety, the writer has for many years advised the potting of all rare or difficult Lily bulbs for the first season, so that they may have a reasonable chance of becoming established before they are planted out. If, however, the plan initiated by Mr. Perry is as successful as seems probable, the losses of imported bulbs should be greatly reduced, because bulbs raised in New Zealand reach this country in

the late spring when the ground is in a far more comfortable condition to receive them than it ever can be in winter. In the result the bulbs should grow on through summer and autumn and be well established before the winter. No doubt the difference of season in New Zealand and Britain makes such an enterprise possible, but the habits of Lilies raised in New Zealand can hardly be permanently affected in such a short time, and it may be expected that the various species concerned will soon revert to their ordinary habit. So that though New Zealand raised bulbs of *L. regale*, for example, planted out in April may flower in the following October, they will probably flower at their normal season (July) in the subsequent year. While that, however, is of no importance, the fact that without going through an over-long period of storage, bulbs can reach England in time to be planted in early summer instead of early winter or mid-winter, should prove of great importance to growers.

No new species of Lily has made an appearance during the year, nor can very much more be expected in that direction, for the areas of the world where Lilies grow have been explored. It is to hybrids that those who care for such things must look for novelties in the future. A year seldom goes by in which one or more hybrid Lilies are not seen or heard of, and though their first appearance is often also the last, the hybrid is seldom worth many tears. Rather more than that may be said of a hybrid Lily which Messrs. Bees exhibited at Vincent Square on June 29 of last year. It is named after the late Miss Roemer, who made the cross between *L. Parryi* and *L. parvum luteum* some years ago when on Mr. A. K. Bulley's staff. Apart from the fact that it is a gentle thing in itself, the plant is a good hybrid in the sense that it combines the characters of each parent in foliage, flower and bulb. If only it has the constitution all hybrids of *L. Parryi* have hitherto lacked, gardeners will give Miss Roemer's Lily the welcome a well-bred plant deserves. Gentle protest has been made in these columns before now against the indefensible practice of bestowing specific names on plants of known hybrid origin, and that protest may be renewed in the case of the so-called *L. Roemerii*.

During the year seeds of several Lilies collected by George Forrest in his 1924-1925 exploration of south-eastern Tibet were received from Mr. J. C. Williams, of Caerhays, and have germinated. Bulbs, too, of a form of *L. longiflorum* reputed to be indigenous to Hong Kong have come from Mr. Tse. A point to be noted is the re-entry of Bermuda into the list of countries whence we import Lilies. An interval of about twenty-two years has elapsed since Bermuda ceased to export bulbs of *L. longiflorum* on a large scale, and since then this country has relied almost entirely on Japan for bulbs of this species. No doubt the commercial success of an enterprise of this nature depends mainly on questions of price and quality. Of the latter there is fortunately no doubt, and the financial side may safely be left to the Bermuda growers. The recapture of lost markets is always difficult, but with the Empire spirit abroad, the Bermuda farmer re-enters the British market with every prospect of success. The photograph (Fig. 36), reproduced by courtesy of the Director of Agriculture, Bermuda, illustrates a field of *L. longiflorum* eximium, and the plants show how successful the cultivation has been.

Luther Burbank, who died last year, had probably produced more hybrid Lilies than all other experimenters put together. Naturally, he made more use of the Californian species close to his hand than of species foreign to North America, and some of his *L. Parryi*, *L. pardalinum* and *L. Humboldtii* hybrids were robust and some very beautiful. Numbers were tried in this country many years ago, but it is doubtful if a single one remains to-day. Colonel Hugh Warrender, the distinguished amateur gardener, was an enthusiastic and successful grower of lilies, and was always ready to help others who had not studied their cultivation so closely as he had. *A. Grove*.

## PINUS LARICIO.

(THE CORSICAN PINE.)

THE illustration depicted in the Supplement Plate accompanying the present issue is from a photograph by Mr. Heyworth, Knighton, Radnorshire, and represents a small group of *Pinus Laricio* growing at Stanage Park.

FIG. 37.—*LILIUM TENUIFOLIUM*  
In the Royal Botanic Garden, Edinburgh, in 1925.

These Corsican Pines—or as they were called at the date of their planting, *Altissima* Pines—belong to a rather remarkably well-grown group of bundle-leaved members of the *Pinaster* sub-division, or family section, of hard-wood Pines.

The name "*altissima*" seems at this date to

have dropped into disuse, "forgotten, and by the world forgot." Loudon mentions the fact of its being once an acknowledged name, but whether as applied to the typical representative or to some variety, he has to plead ignorance. This exempts any one to-day attempting to find a why or wherefore of its disuse, and, for the matter of that, discourages any one from trying to discover an explanation, as to why it came to be called the Larch Pine instead. Why and how these trees came to be called after a Larch is a mystery quite beyond my powers to penetrate. The Larch sub-tribe certainly has not returned the compliment and called any one of its family species, by, for instance, such a name as *Larix Pinaster*, which latter word is the title of the family group to which the Corsican immigrant belongs. I still am of opinion—and every one has a right to the moderate exercise of that little faculty—that our predecessors, were more happy in naming the tree "*altissima*" than later generations in calling it *Laricio*.

A little comparison with other Corsican giants, as mentioned and measured in Elwes and Henry's *Trees of Great Britain*, would, perhaps, not come in here amiss. The measurements of our five trees, referred to here, represent an average height of 117 feet and an average girth of eight-and-a-half feet at four feet from the ground. I append the measurements of our trees and of the four largest alluded to by Elwes and Henry:—

Stanage Trees.—Height 118 feet, girth 8 feet 7 inches; height 130 feet, girth 8 feet 9 inches; height 112 feet, girth 9 feet 2 inches; height 105 feet, girth 7 feet 10 inches; height 120 feet, girth 8 feet 5 inches.

Trees mentioned in *Trees of Great Britain*.—Height 119 feet, girth 8 feet 3 inches, at Brocketta; height 100 feet, girth 9 feet 3 inches, at Arley Castle; height 108 feet, girth 11 feet 5 inches, at Dropmore; height 80 feet, girth, 9 feet 3 inches, at Kew Gardens.

In all fairness, it must be noted that our Stanage trees were measured here some eighteen years after the four described by Elwes and Henry. How many cubits they may have added to their stature, and what magnitude round about they may have achieved in those fateful intervening years, it would be more interesting than possible for me to ascertain and set forth. How near, too, to the length and breadth, namely, 150 feet of height and twenty feet of girth, they may have approached in size these giants growing in their Corsican island home, I would I knew, and could tell. I can only say that if they have outgrown by this time my nominees I would be willing to back them against all comers in a group class of five.

I append an extract from notes made by my ancestor and predecessor here, in his tree-planting book of chronicles, and quote it verbatim: "In 1828, and in March, there were planted some ninety Corsican Pines, called in those days '*Altissima*,' and raised from seed that came from Corsica. Some of these plants were given to Lord Grenville, and planted at Dropmore." From this account the trees planted here should claim at least a cousinly kinship with the shorter, burlier, bulkier example at Dropmore! In 1834, the record goes on to say, that some of these trees (the subjects of the illustration) were transplanted to their present site. One of our trees displays the rather indefinite attributes ascribed to a so-called variety *Pallasiana*. That is to say, it shows the rather stout branches curling out from the stem in candelabra fashion, and then arising in erect form and parallel with the main stem. Whether a rather vague habit, affected by many other representatives of the arboreal kingdom, gives such a specimen the right to assume the dignity of a special courtesy title, is a question, that would be a profitless waste of time for any one so unauthoritative, as I, to enter upon.

Before bringing these few observations to a close, I should like, humbly, to call the attention of would-be planters of this tree to two points derived from personal experience. It was some twenty-five years ago (and I told this story in *Characteristics of Conifers*) that here I planted one, when rabbits roamed as thick as Milton's "Autumnal leaves that strow the brooks in Vallombrosa," and where

# THE WORLD'S LARGEST ANNUAL SUMMER FLOWER SHOW

THE 1927 SHOW WILL BE HELD ON

**Wednesday, Thursday and Friday, August 24th, 25th and 26th**

**COMPETE AND WIN AT THE WORLD'S LARGEST SUMMER FLOWER SHOW AND BE PROUD OF IT**

Horticultural Appliances and Horticultural Sundries may be exhibited in the Show Ground.  
Rent of Spaces from £5. ————— There is no charge for spaces for Formal Gardens.

*The 1927 Schedule will be ready shortly and may be obtained post free from the Secretary, Town Hall, Southport. A copy of the beautifully illustrated Official Guide Book to Southport will also be sent post free on application to the Secretary.*

**Through Carriages each week-day from London (Euston) to Southport.**

rabbits passed and repassed in quest of morning and evening meal and drink. The rabbits to-day have not (alas!) quife, but nearly (thank Heaven!) disappeared from the scene of their once—I shame to say—rather encouraged activities, but the tree remains, a respectably grown and monumental evidence of the bitter distaste in which it is held by a race of epicurean rabbits.

The second point that I should like to urge is, plant the Corsican Pine late in the spring. Those who have made experiments strongly advise spring planting; without daring to dogmatise, I would suggest early May as a suitable date. If the long tap-roots make difficulties in transplanting, they are of great avail in the day of storm and tempest, as the wreckage proved when taking account of the results of the gales in December and January of 1915-1916.

The Corsican Pine has very many close relations, besides its Austrian congener (*P. nigricans*) *inter alia*, *P. sylvestris*, *P. leucodermis*, *P. Thunbergii*, *P. densiflora* and *P. resinosa*, but *P. Laricio* holds his own and his head high amongst them all. *Chas. Colman Rogers, Stanage Park, Radnorshire.*

## PROMISE AND PERFORMANCE.

WHEN the plants we have seen during the year at shows, in gardens and in catalogues become our own we are generally pleased, but there are occasional disappointments.

Bulbs, on the whole, arrive satisfactorily, but the sizes should be stated by the bulb merchant where possible, e.g., *Lilium auratum* platyphyllum, 8-9, 9-11, 11-13, or 13-15, inches in circumference—with prices for each measurement.

Packing is very important when bulbs are dispatched, especially where brittle shoots are to be considered, e.g., *Erythronium*, *Eremurus* and *Juno Iris*. Sawdust, commonly used, should be avoided as it retains damp. Wood shavings are excellent. Infusorial earth (Fuller's earth) is quite reliable but expensive; husks and chaff are good but are liable to carry seeds which germinate when the bulbs are planted. There are worse things than paper. Damp moss naturally encourages bulbs to grow in transit and should, therefore, not be used as packing material.

Bulbs, especially English-grown, are usually free from disease, but diseases abound in continental supplies, notably in *Freesia* and *Amaryllidaceae*.

Irises are very commonly divided too severely, and the little plants received are unlikely to flower until the third year. Further, Irises often do not reach the purchaser until November or December, which is really too late for planting.

All good firms now grow Michaelmas Daisies and Phloxes from cuttings, which is a better practice than dividing whole clumps. Kniphofias seem scarce and in demand, judging from the small growths that are sent out.

Shrubs demand more detailed consideration. In the first place the catalogue should give the approximate height of the plant offered at a given price, e.g.,

<i>Salix vitellina</i> (alba)	
pendula ...	Good heads, 6 to 10 ft.
	" " 10 to 13 ft.
	Extra strong specimen trees 13 to 16 ft.

Next, nomenclature should be carefully checked, the *Kew Handlist* being a good guide so far as it goes. Plants should not be called "var. *superba*," "var. *gloriosa*," "var. *hirsuta*" or, again, "var. *Lawrencei*," or "var. *Burfordiensi*," until the distinctive characters of the plant, and the name, have been recognised by a competent authority.

In the descriptions, particulars of transplanting and of root-pruning—a practice much neglected—should be given. It should also be stated whether a shrub is a seedling—when the probability of trueness to type or otherwise

should be indicated—a layer, a cutting, grafted or budded. In the last two cases the stock should be given, e.g.,

<i>Daphne Genkwa</i> grafted on <i>D. Mezereum</i>	12 in.
	On own roots 30 in.
<i>Magnolia Watsonii</i> , grafted low down on	

<i>Magnolia hypoleuca</i> ,	4 ft.
-----------------------------	-------

In the case of Roses it is more important to the purchaser to know the stock than to learn that the plants are, say, Manx-grown.

No self-respecting firm should send out old or infested plants; if they have no young stock it is open to them to say so, and if the purchaser is willing to risk a veteran, that is his concern.

In the case of uncommon plants, cultural directions are useful, e.g.,

*Olearia insignis*: will stand zero frost but must be kept dry, with good circulation of air; light soil.

Packing, in the case of shrubs, is becoming a fine art, and all branches should be tied to the main stem or to a stake, the roots being tightly tied into a mat containing moist straw or Bracken. The rough handling of "passenger train" parcels at a London terminus will suggest the need for adequately protecting plants that have to travel far.

Finally, it would be of great assistance to the purchaser to have all this information typed on to a pro forma invoice to be sent in duplicate a week before the probable arrival of the plants.

Many of the points enumerated above are counsels of perfection, but they are points that have suggested themselves to us at Burford, while unpacking plants received in the autumn and winter of 1926. *William Lawrence.*

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Continued from p. 51.)

THERE are numbers of varieties of the Banana growing in the Bay Islands, but the only one grown for export is the so-called Jamaica, Martinique, Guadeloupe, Bluefields, or Gros Michel Banana, known locally as "French" and among the Ladinios as *Patriota*, or *Blanco*. It is the only variety which enters largely into world trade and practically the only one exported from the American tropics. The principal market is the United States, and to a much smaller extent, Canada and the countries of north-western Europe. This is a variety of *Musa paradisiaca sapientum*; it produces a larger and comparatively less bulky bunch than any one of the other varieties, and is, therefore, easier to handle.

The only Banana suitable for cultivation in the temperate zone is the Chinese or dwarf Banana, (*M. chinensis* (syn. *M. Cavendishii* and *M. humilis*), which is little cultivated in the Bay Islands, but in the Canary Islands is largely grown for the European market. It is also found in Florida and South Louisiana, where it is known as the Horse Banana. In tropical America this variety is found in great altitudes, where other species would perish.

The White House or Horse Banana, known as *Chata* among the Ladinios, is a short, stout, somewhat square-shaped, thick-skinned variety which is very mealy and therefore best suited to flour making. This will prosper in low land which remains flooded during a considerable part of the year and where other varieties will not grow. The red Banana is generally found in a wild state; it grows on a very large plant, which is very resistant and hard to kill out, but it exhausts the soil quickly. The fruit is shorter, but a little thicker than the common French Banana. The Parrot Banana is similar to the red one in size, shape, texture and flavour, but green, not becoming red but yellow, when ripe.

The small Apple Banana, or *Guineo de Manzana*, has a bright yellow colour and a very thin skin; when well-matured it has a fine flavour, somewhat reminding one of Apples.

The Plantain or *Polatano* (*Musa paradisiaca normalis*) is a very near relative of the Banana; it requires better care, is also more esteemed for food, and yields a better price. There are a number of varieties of Plantains which are not always easy to distinguish from the Banana, and it is difficult to say where one begins and the other ends. But, in general, the name Plantain is restricted to the larger, coarser varieties of *Musa*, which are inedible without cooking. Small quantities are shipped to the United States.

The natives know the different varieties of Bananas and Plantains by the size, shape and colour of the leaves, and some are even able to distinguish them by the underground stem or rhizome used for propagation.

## MANGO AND PINEAPPLE.

The Mango (*Mangifera indica*), although a native of the East Indies, is one of the most common fruit trees in the Bay Islands; it is found all over Central America, from sea-level to an altitude of 5,000 feet to 8,000 feet (1,500 m.) having first been brought to Truxillo during the latter part of the eighteenth century. It has large and spreading branches, and reaches a great size, and, on account of this, is also esteemed as a shade tree. The smooth, shiny, leathery leaves reach a length of six to eight inches (15 to 20 cm.); they are dark green in colour, except the young ones, which are purple. The tree is easily propagated by budding. If raised from seeds, the latter must not be allowed to dry too much, otherwise they will not germinate.

The delicious fruit of the Mango tree matures in the Bay Islands in May and June; it is highly appreciated by the average foreigner, but, unfortunately, it does not keep long, and is, therefore, unsuitable for export. The Mango season lasts only four to five weeks, as all the trees have their fruits maturing at the same time. The Mango is slightly Pear or kidney-shaped, with a yellowish-green colour and generally red cheeks. The thick, smooth rind covers a fibrous, sub-acid, very juicy pulp, which in turn surrounds a large, flattened stone. The fruit reminds one somewhat of a cling-stone Peach, especially as the flesh adheres closely to the stone. There are many varieties of which the more common have a very pronounced turpentine-like odour and flavour; these are also smaller and the pulp consists largely of fibre and juice. The Mango is locally considered a very healthy fruit, and said to contain blood-purifying properties.

The Pineapple or *Piña* (*Ananas sativus*, syn. *Ananassa sativa*) is the fruit of a small Bromeliaceous plant with dark green leaves and of tropical American origin. During the latter part of the sixteenth century Portuguese and Spanish navigators introduced it into Asia and Africa, and many travellers have erroneously ascribed its origin to the Old World. The plant is found growing wild in parts of South and Central America, where it produces a spiny fruit of the size of an Apple. The presence of the Pineapple in America was noticed by the early Spanish and Portuguese chroniclers, and the Indians have practically everywhere native names for it.

The Pineapple is considered an excellent digestant if taken after a meal. There are many varieties varying in colour from yellow to red. It is a compound fruit, being produced from a group of flowers and not from a single one. The Pineapple is entirely seedless, or has very small seeds close to the skin. From these seeds new plants may be started, but this process is very slow, and as it takes from ten to twelve years for such plants to come into bearing, so seedlings are practically only raised in order to obtain new varieties. In Africa, however, the fruits contain many black seeds from which, it is claimed, seedlings can easily be raised.

New plants may be grown by planting the crown of leaves from the top of the fruit, but practically all the Pineapples of commerce are produced from the suckers which spring up from the root-stock. In about one year from the planting of the sucker a bunch of purple flowers will make its appearance, which

will develop into one fruit; the latter will be full-grown within six months. One year afterwards, the second crop, consisting of two Pineapples, will be matured. In another year the plant will have three branches, each one of which bears a fruit, but as the fruits diminish in size from the first crop onwards, three years is the productive limit.

Formerly, Pineapples used to be shipped from the Bay Islands and from Utilla in particular to the United States, but nowadays the inhabitants find it more profitable to cultivate Coconuts and Bananas for export. When destined for shipment, the fruit is cut before complete maturity is reached, and the crown of leaves on the top is left attached. The leaves of the Pineapple plant, which are armed with strong, sharp prickles, contain a very tough fibre, but this is not made use of.

#### BREAD FRUIT AND PAPAW.

The Bread Fruit or Mazapán (*Artocarpus incisa*, syn. *communis*), is much cultivated in the Bay Islands on account of its large, edible fruits. The tree is a native of the south Sea Islands, and in 1793 was brought to Jamaica from Otaheite, together with a number of other fruits, by Captain Bligh, in H.M.S. Providence. In 1796, it was introduced into Trujillo, and by Royal Order was subsequently taken to other parts of Central America. It is now common on both coasts, from sea-level to an altitude of about 2,500 feet (750 m.).

The tree reaches a height of seventy-five feet (25 m.), and on account of the dense foliage, which is not all shed at the same time, it is esteemed as a shade tree. The smooth, bright, green leaves are divided into pointed lobes which reach sometimes up to eighteen inches (45 cm. in length.)

The Bread Fruit tree bears two kinds of flowers on the same twig, the one with a small round head producing the fruit. In the Bay Islands two crops are obtained annually, the first one in March or April, and the second one during the months of August, September and October. The fruits grow singly or in clusters of three to four, and they are attached to the twig by a very thick stem. Like the Pineapple, it is a multiple fruit, and the rough surface is marked off in little polygons corresponding to the individual fruits. The Bread Fruit has the shape of a large Aubergine; its thin skin is of an emerald-green colour. After being taken from the tree it has to be consumed immediately for it will keep only a few days. It is prepared in many different ways: boiled in water it tastes somewhat insipid, and it is generally fried, roasted or baked. When prepared by the last-named method it reminds one of bread, hence the name. It also suggests the Sweet Potato and the roasted Chestnut, and on this account probably it is called Castaña (Chestnut) in the Spanish-speaking West Indies. This may, however, also be due to the fact that its seeds resemble Chestnuts in size, shape and colour for in the West Indies the variety with seeds is generally found, while in Central America the Bread Fruit is entirely seedless.

The East Indian variety of Bread Fruit, which is better known as Jack Fruit (*A. integrifolia*), has entire leaves and a much larger fruit of inferior quality; this was also brought to Trujillo in 1796, but is not met with in the Bay Islands. It is easier to propagate than *A. communis*, and may be raised from seeds.

The Papaw or Papaya (*Carica Papaya*) is a small tree, fifteen feet to twenty-five feet (3 to 5 m.) in height, of tropical American origin. The straight stem, which is entirely branchless, is surmounted by a crown of long, petiolate, palmate, seven-lobed leaves, immediately below which grows numerous Melon-like fruits. The latter are green in colour but become yellow when ripe. In the Bay Islands this tree is found only in a cultivated state, but on the Central American mainland are found several species of wild Papaw trees, which bear very small, globular fruits of inferior quality.

The tree is propagated from seeds and grows very rapidly; within three years from planting it will bear fruit. The male flowers are white and the female yellow, but only very seldom

are both kinds found on the same tree. Fruits are borne all the year round.

The Papaw is oblong or round; it has a thick rind and pulpy flesh. In the centre there is a hollow enclosing hundreds of round, black seeds of the size of Black Pepper. In taste the fruit suggests a Cantaloupe Melon.

#### CASHEW AND AVOCADA PEAR.

The Cashew or Marañon (*Anacardium occidentale*) is the fruit of a low tree with spreading branches and oval leaves, which is indigenous to tropical America, but now found in many other parts of the world. In the Bay Islands it is cultivated and also found growing wild. Several varieties are found which differ considerably in the size and quality of the fruit. The milky juice of the bark is locally used for marking linen. From the fruit a refreshing drink is made which may be left to ferment and is then known as Cashew wine (*vino de Marañon*). *Edouard Conzemius*, 33, Boulevard des Batignolles, Paris.

(To be continued).

### MESEMBRYANTHEMUM.

(Continued from page 53.)

**Conophytum praeparvum**, N. E. Br. (Fig. 38).—Growths as received very small, crowded, 2-3 lines long and 1-2 lines in diameter, shortly obconic or obovoid, elliptic or circular in outline and convex without any trace of a ridge across it at the top; orifice  $\frac{1}{4}$  line long, level with the sur-

FIG. 38.—CONOPHYTUM PRAEPARVUM.

A. Cluster of growths, natural size as received; B. A single growth enlarged three diameters.

face and neither depressed nor gaping; surface glabrous, light green, sprinkled over the top with a few scattered dark green or purple dots that are mostly separate, but occasionally are connected into short lines and are remarkably prominent, resembling little bumps on the surface when viewed sideways with a lens, 2-3 of them are grouped at each end of the orifice, which also has a very slender dark green line on each side of it. Flowers not seen.

Little Namaqualand: On the Langebergen near Garies, growing among or mixed with lichens on granite, Marloth 12887!

This is one of the smallest species of this genus known to me and is one of the smallest of flowering plants. I am indebted to Dr. R. Marloth for living specimens of it, from which the above description was made. Its small size and the very prominent bump-like dots upon it readily distinguish it from all other known species. As a lichen was growing mingled with the plants sent, it is evidently one of the species that grow among lichens, a habitat shared by other members of this genus.

**C. retusum**, N. E. Br.—Growths  $\frac{1}{2}$ -1 inch high, 3-9 lines broad across the top and 2-4 lines thick on their first development after importation, normally compressed and wedge-shaped, shortly two-lobed at the top, and when fully developed about twice as broad across the lobes as at the base; in this form the lobes are 1-2 lines long and in side view are somewhat truncate with a slight notch (retuse) at their top, bluntly keeled; in another form produced on the same plant the growths are somewhat obovoid and not at all wedge-shaped, and the top of the lobes in side view are rounded and not at all divergent or truncate; orifice  $1\frac{1}{2}$ -2 $\frac{1}{2}$  lines long; surface smooth glabrous, light green with a darker patch at the base of the

notch and some rather indistinct separate dots scattered over the surface, more evident on some growths than on others, while the lips of the orifice are somewhat indistinctly outlined with a dark green line or chain of dots. Flowers not seen. Capsule 2 lines in diameter, slightly 5-angled, shortly and broadly obconic, slightly convex on the top, with 5 valves and cells, brown; when expanded  $3\frac{1}{2}$ -4 lines in diameter, with recurved brownish valves; expanding-keels contiguous and forming a stout, acute, brown, central keel with broad, membranous, pallid, marginal wings; cells open, no tubercle. Seed about  $\frac{1}{2}$  line long, ovoid, but much compressed, with a very prominent nipple at one end, smooth, brown, the nipple darker.

Little Namaqualand: On rocks, in the gorge of the Kavarass River, in the Richtersveld, Marloth, 6925!

This plant I also owe to the kindness of Dr. Marloth. It belongs to the same group as *C. Elishae* and *C. bilobum*, but differs from all other species that I have seen in its very distinctly and broadly wedge-shaped growths, with the top of their lobes slightly notched or truncate. Whether it will retain this unique character under cultivation remains to be seen, as I notice that some of the new growths are quite different in form, being obovoid with short, rounded lobes on each side of the notch.

**C. tantillum**, N. E. Br., in *The Gardeners' Chronicle*, 1926, vol. LXXIX, p. 12. This distinct species having now flowered with me, the following corrected description of the flower may be added: Calyx 4-lobed, tube only partly exerted, 3 lines long, whitish or pale greenish; lobes  $\frac{1}{2}$ - $\frac{3}{4}$  line long, greenish, but probably reddish in full sunshine. Corolla 6-7 lines in diameter, expanding in daytime in dull or sunshiny weather, not scented; tube 5-6 lines long and 1-2 lines longer than the entire calyx, nearly 1 line thick, whitish; petals about 20, recurved-spreading, in 1-2 series, 3-3 $\frac{1}{2}$  lines long and  $\frac{1}{2}$ - $\frac{3}{4}$  lines broad, linear, obtusely rounded or faintly notched at the apex, bright magenta. Staminodes none. Stamens 25 or more, in about 4 series, the two upper series exerted from the mouth of the corolla-tube; filaments and anthers yellow. Style 6 lines long and nearly as long as the longest stamens; stigmas 4, minute,  $\frac{1}{2}$  line long, yellow.

Little Namaqualand; near Steinkopf, Meyer. (Marloth 6512)!

This is quite a pretty plant when nicely in flower, although it cannot vie with the beautiful *C. minusculum*, which has much larger and much more richly-coloured flowers.

#### 3. LITHOPS, N. E. Br.

The following species are additional to those already described in *The Gardeners' Chronicle*, 1922, vol. LXXI, p. 55, and 1926, vol. LXXIX, p. 80.

**Lithops Fulleri**, N. E. Br.—Growths about an inch high, 12-14 lines broad and 8-10 lines thick, obconic, elliptic in outline at the flat top which has a fissure 5-6 lines deep across it, dividing it into two contiguous lobes; surface glabrous, smooth on the sides and margin of the top, which is rough from being covered with small bumps caused by numerous impressed dendritic markings, light dove-grey with a slight violaceous tint on the sides and margin of the top, and the dendritic markings of a bright rust-brown colour, making a very pleasing contrast. Flowers not seen.

Kenhart Division: Near Kenhart, Fuller!

This very distinct species was very kindly sent to me by Professor R. H. Compton, Director of Kirstenbosch Botanic Garden, with the information that it was discovered near Kenhart by Mr. E. R. Fuller, to whom I have much pleasure in dedicating this very pretty species, which is, perhaps, more nearly allied to *L. karasmontana*, N. E. Br., than any other known to me, but is readily distinguished from that species by its more crowded dendritic markings, rougher top and different colouration, and probably when flowers of it are known they also will differ, for in my opinion it is certainly not a mere variety of that plant. N. E. Brown.

(To be continued).

## MARKET FRUIT GARDEN.

THE wettest November in my experience was followed by the driest December, the respective rainfalls of the two months, 8.16 inches and 0.79 inches, making a striking contrast. The total rainfall for the year at my place was 33.25 inches. The average for the previous twenty-five years was 29.97 inches, and 1926 was the fourth year in succession with over average precipitation. To this may probably be attributed, in large measure, the difficulties and disappointments which most fruit-growers have experienced during that time. The industry has passed through a period of depression; but there is, fortunately, some reason to hope that the lowest point was reached in 1926, when industrial unrest intensified the financial effect of very low yields of the most important crops. Although it was a wet year, it was distinctly drier than any of the three preceding it; and the weather of the summer months, which has such an important bearing on prospects for the next crop, was undoubtedly more seasonable. It is not unreasonable to hope, therefore, that 1927 may prove to be more prosperous. Most growers, having disposed of their light crops at an unusually early date, wisely set themselves to push forward with winter work, with the result that many plantations will be in extra good order for the coming season.

## WINTER SPRAYING.

It is very seldom that December affords such excellent conditions for winter spraying. Not only was the weather dry but also, on many days, perfectly still. All my Plums, except for a few young trees, were sprayed with tar-distillate wash, and several acres of Apples were done as well. There is not much doubt that every tree on the place will receive its application before the middle of February. One advantage of getting this work done early is that, in the absence of strong sunlight, the wash does not burn the skin to any serious extent. In previous years several of my men have had their faces painfully scorched, but always on unusually warm and sunny days. Various forms of masks and veils which I have tried have always been discarded because it is difficult to see through them. The best protection is afforded by smearing the face with lanoline—not the thin, scented preparation sold in tubes for toilet purposes, but the plain grease, which is much thicker. This may be obtained from most chemists, as it is supplied largely to men engaged in the work of tarring roads. Another advantage of early spraying is that earthworms are not killed. In my last notes I mentioned that tar-distillate washes destroy thousands of worms, and it has been my experience previously that the ground is covered with dead worms after the spraying. This year I have not seen any. I can only conclude that the worms are too deep down in the soil during mid-winter for the wash to reach them.

## CULINARY VERSUS DESSERT APPLES.

About sixty per cent. of the area under Apples on my place is devoted to dessert varieties, which is an unusually high proportion for a fruit farm in this country. I used to be of opinion that the planting of Bramley's Seedling and other late cooking varieties was being overdone, but I am inclined to alter that opinion. Dessert Apples seem more attractive on account of the higher prices they realise when a good sample is produced. But price is not everything. A good crop of high quality is not grown by any means every year; and considerable labour and expense are incurred in pruning and spraying. Some of the robust cooking varieties are more reliable, less seriously attacked by pests and diseases, and altogether less expensive to grow. If the price is lower, yields are heavier and more regular. The idea of a large plantation of standard or half-standard Bramley's Seedling, with a few Newton Wonder and Annie Elizabeth to act as pollinators, is distinctly attractive. Bramley's Seedling needs little pruning or spraying, and it may be relied on to yield a heavy crop in alternate

years. For the first ten years after planting bush fruits could be grown between the trees, and after that the plantation could be grassed down and the herbage grazed with sheep or pigs. Expenses would thus be low. Any one who cares to work out the probable return on the conservative basis of a moderate crop in alternate years only, will find that quite a fair living could be made from a good-sized plantation of this kind. In the "off" years the grower could almost go away for a holiday! Yet the attraction and interest of dessert Apples are so great that I do not practice what I preach. Even this winter I have run the risk of adding another locally-untried variety to my list of dessert kinds, having grubbed a belt of the almost worthless Duchess of Oldenburgh and replaced it by Langley Pippin.

## WINTER STAGE OF APPLE SCAB.

Whilst pruning recently I have found more than the usual amount of scab on the young shoots of several varieties of Apples, especially Cox's Orange Pippin. In some cases almost the whole of the young wood has had to be sacrificed for this reason. It was noticeable last summer that the disease was active and spreading unusually late, and this is no doubt the result. Late spraying to protect the young

## FRUIT REGISTER.

## APPLE RIVAL.

As a dual-purpose Apple, I strongly recommend the variety Rival. The tree is a good, strong grower, crops regularly and well, and the fruits are very good, either for dessert or cooking. The variety has also the good quality of being in season for a long time, in fact, here in north Hampshire I consider it, taken all round, one of the most useful and reliable Apples grown. T. B.

## PLUM DIAMOND.

THERE are two accounts of the origin of this excellent culinary Plum (Fig. 39). Bunyard in *A Handbook of Fruits*, states that it was found by a farm labourer in a hedge in Kent, and that a nurseryman named Hooker of Brenchley introduced it to commerce in 1830; Dr. Hogg, however, in *The Fruit Manual*, states that it was raised in Mr. Hooker's nursery. Whatever the origin, the quality of the variety has never been called in question; Hogg states that it is one of the best Plums for preserving or cooking. The variety is very popular with some private gardeners, and at one time it

FIG. 39.—PLUM DIAMOND.

shoots would probably have paid, but one feels disinclined to go to the expense of extra spraying in the case of trees that are bare of fruit. Scab has grown gradually worse during four wet seasons, and a dry summer is badly needed to give it a check. Cutting off and burning affected wood removes one source of infection, but there still remain the dead leaves under the trees. Obviously, preventive spraying with Bordeaux mixture or lime-sulphur just before and after blooming will be very necessary this year.

## THE DORMANT SEASON.

We talk about fruit trees being dormant during the winter, but it seems to me that they are never quite inactive. The fruit buds of Apples have certainly developed since the leaves fell. They look rounder and plumper than they did at the end of November. Decided movement can be seen also in the buds of Black Currants. Nor does root development appear to be quite at a standstill. I have often found that, if bush fruits, particularly Gooseberries, are laid in to await planting, and left till January or February, they have made quite a lot of fibrous root by the time they are lifted. Probably vegetation is at a complete standstill only during cold periods, and a certain amount of movement takes place during mild spells. Market Grower.

was cultivated extensively for market, but it is not so much grown now owing to the blossom developing so early as to be often injured by frost. The tree makes good growth and may be relied on to fruit freely when the spring is favourable to the flowers setting. The fruits are very large; they are dark purple, almost black, with a pretty bloom, and of the oval shape shown in the illustration.

The variety was exhibited by Mr. J. C. Allgrove at the meeting of the Royal Horticultural Society on September 7, 1926, when the specimens illustrated were photographed.

## APPLE REV. W. WILKS.

THIS is a culinary Apple of first-rate quality, and one which should not be overlooked by those who are making up deficiencies or planting new orchards. It is one of the largest varieties in cultivation, and the growth is vigorous, making an evenly-balanced tree.

A standard specimen planted here in 1921 carried a full crop during the past season, and many fruits weighed over a pound each.

It is in season from October to December. Though somewhat colourless, the ribbed fruits are attractive in appearance. It is one of the finest of culinary Apples when cooked. Charles Hodgson.

## EMULSIFIED OILS FOR THE DESTRUCTION OF INSECT EGGS.

(Concluded from p. 54.)

THE following comparisons of various types of tar and creosote may be of interest as they illustrate the wide variance in composition which must of necessity greatly influence the value and action of any emulsion prepared therefrom.

GAS-WORK TAR FROM DURHAM COAL.		RUHR COAL (VERTICAL RETORTS).	
	Per cent.		Per cent.
Ammoniacal liquor	3.9	1.5	
Naphtha	1.63	3.6	
Carbolic oil	11.87	15.5	
Creosote oils	4.37	11.6	
Anthracene oil	21.87	30.0	
Pitch	53.65	37.0	
Loss on distillation	2.71	8	

COKE OVEN TAR.		A.		B.	
	Per cent.		Per cent.		Per cent.
Water	4.5	4.0			
Naphtha	5	25			
Light oils	1.0	1.75			
Creosote oils	17.4	18.0			
Heavy or Anthracene	18.6	10.0			
Pitch	58.0	66.0			

WATER GAS TAR.		Per cent.		Per cent.	
Light oils	1.99	3.68			
Middle oils (creosote)	14.87	28.27			
Anthracene oils	57.28	39.66			
Pitch or residue	24.72	24.10			
Loss	2.04	4.29			

Creosotes specification from various sources.

### DISTILLATION TESTS.

Comparison of creosote and anthracene oils.

	Creosote Oil.	Anthracene or Green Oil.
Up to 200°C.	10-15	5
Up to 220°C.	50	10
Up to 250°C.	75	15
Up to 300°C.	90-95	40
Up to 320°C.	—	50-60
Specific gravity	1.02	1.05-1.10
% Phenols	15-20%	—

Anthracene oil is even of a more complex composition than creosote. In view of the complexity it is extremely difficult to identify egg-destroying characteristics with any particular constituent. This makes it equally difficult to standardise washes made from this material. The only rational way of doing so is to always maintain the same source of supply and keep

a very careful chemical control of the particular fraction to be used.

Anthracene oil is not a very difficult oil to emulsify, provided the anthracene is removed so far as possible either by freezing or washing. This can be accomplished by various methods, but one of the great secrets is to produce an emulsion which, on dilution with water at the standard prescribed strength, has such a viscosity and surface tension that a lethal amount of oil emulsion is retained by the exposed surface of the insect egg owing to its natural resistance.

If these two physical factors are varied, as for example, lowered, and this is possible by altering the state of the emulsion so as to form a colloidal suspension or solution, an insufficient quantity of the oil is retained, and consequently the percentage of egg destruction is considerably reduced.

In order to secure the best results with a tar-oil wash it is desirable to have a spell of fine weather following its application to the trees, so as to obtain a thorough drying out of the film, which in the presence of atmospheric CO<sub>2</sub> causes a de-emulsification of the oil.

It has been observed that trees sprayed with the standard concentration of any of the recognised brands of tar-oil emulsion subsequently bear a much more luxuriant growth of foliage and generally present a more healthy appearance. This is probably due to the partial sterilising effect of the excess of wash that is bound to penetrate the soil from drippings, etc. The effect upon the cleanliness and extent of the crop is also very remarkable. The difference between an unsprayed and sprayed portion of an orchard is so pronounced as to be absolutely astounding.

The table below forms a guide for the treatment of the most common parasites and fungous diseases by means of spraying with tar-oil wash (standard). *Theodore Parker.*

## VEGETABLE GARDEN.

### LETTUCE.

WHERE Lettuces are required all the year round it is advisable to make an early sowing in January. The compost for the seed-boxes or seed-pans should consist of equal proportions of good loam and leaf-mould mixed with a liberal quantity of sand. Shallow boxes are preferable to seed-pans, for the soil in the latter dries out much quicker, whilst boxes retain moisture much longer. The soil should be made fairly firm and even before sowing the seeds, which should be covered very lightly with some of the compost. Place the box on a gentle hot-bed that has been prepared for forcing early Melons or Cucumbers, or, failing that, place them

on a shelf in a fairly warm house. Keep the boxes covered with a sheet of glass and in sunny days shade the soil with a piece of paper. So soon as the seeds germinate, tilt the glass, and when the seedlings have grown strongly, remove the glass entirely. Prick out the seedlings into other boxes so soon as they are large enough to handle with safety, about an inch apart, using compost with less leaf-mould, substituting in its place manure from an old Mushroom-bed after it has been passed through a half-inch sieve.

The plants may be returned to a warm house or grown over a gentle hot-bed for a week or ten days until they are re-established. On bright days the young plants may be damped lightly overhead. Harden them gradually in a slightly lower temperature, and so soon as they are large enough transfer them to pits or frames that have been filled previously with freshly collected leaves; the latter will provide gentle warmth, which is all that is needed. The soil for placing on the bed of leaves should be fairly rich; if good loam is unobtainable, use old potting soils, adding a liberal quantity of fresh bone-manure to it. The soil should be placed in position a week or so before planting, and to a depth of about six inches.

Plant the Lettuces about eight inches apart each way and keep the frame closed for a few days and shaded in sunny weather. When the plants are growing freely they should be syringed on bright days and the frame closed early in the afternoons, for Lettuces, at this time of the year, do not require much ventilation. The pits or frames should be protected at night against frost and cold winds.

Successional sowings should be made to maintain a full supply, and these later plants treated much in the same way as the first batch until the weather is favourable for planting them out-of-doors on a warm border. Golden Queen Cabbage Lettuce is a good variety for early cropping. All-the-Year-Round is a valuable sort for the first planting out-of-doors, also for sowing in the open in April. Superb White is a first-rate Cos Lettuce, and where small Cos Lettuces are required, Sutton's Nonesuch may be selected for growing as it forms a small, white head in less time than any of the ordinary Cos varieties. Successional sowings should be made to furnish supplies in summer.

Lettuces should be provided with plenty of moisture to cause them to grow quickly, especially during the summer.

For autumn and early winter supplies, plants raised from seeds sown out-of-doors in August should be transferred to cold frames late in the season, about eight inches apart, whilst the very latest sowings may be made direct in the frames. *E. Neal, Tilgate Gardens, Crawley.*

### SWEET CORN.

THE cultivation of the Maize (*Zea Mays*) does not present any great difficulty, and as a vegetable it commands considerable appreciation. Seeds should be sown in warmth during April, the seedlings potted, grown on under glass, and hardened sufficiently for planting by the last week in May or the first week in June; an alternative method is to sow seeds in the open in late April or early May.

The plant needs a deeply-cultivated and rich soil, a position where it may reap the full benefit of the sun's rays, and, during dry weather, copious supplies of water. Allow the plants ample room; a distance of two feet between the rows and the same from plant to plant is not too much. Each plant should be staked securely. Stimulants are of great assistance to the plants during the later stages of growth. Excellent varieties are First of All, Sutton's Early and Improved Sweet; well-known American varieties are Golden Bantam, Fordhook and Golden Giant, while of those favoured in South Africa, Country Gentleman and Burlington give fine cobs, more particularly the former.

The history of the Maize is lost in antiquity; the generic name, *Zea*, was the Greek name for Spelt, or a similar cereal, and is referred to by Homer; it possibly ranks second to Rice as a food plant, and is very largely grown in warm countries. In the South of England

CROP.	PEST.	TO MAKE 100 GALL. MIXTURE USE	TIME OF TREATMENT	PARTICULARS.
Apple and Pear	Scales, green Aphid, Red Spider, Apple Sucker, Rosy Aphid	7½ galls. ...	Winter and early spring	Cankerwounds can be dressed with 25%-100% strength, depending on the age of the twigs and stems.
	Woolly Aphid, Winter moth, Canker, Monilia	10 galls. ...	Winter and early spring	In summer time apply the tar-oil wash to the nests of Woolly Aphid by means of a brush.
Plum, Cherry, Morello	Aphid and Monilia	6 galls. ...	November to December	Never spray during frost, nor in glasshouses. Spray only when the trees are in dormant stage.
Peach	Peach and Cushion Scale, Aphid and Red Spider	5 galls. ...	Outdoors in the beginning of February. In glasshouses last week of December, first week of January	Loosen the wall trees. Spray and do not brush the twigs and stems with tar-oil wash for this may cause damage to the buds.
Vine	Vine Scale and Red Spider	7½ galls. ...	Winter	The loose, corky scales should be removed from the stems; do not brush them with tar-oil wash, but spray.
Gooseberry	Magpie moth, Aphid, Red Spider, Winter moth	7½ galls. ...	Winter	In some seasons the buds begin to open very early in spring, and although Gooseberry bushes in that stage can withstand a spraying with 7½% tar-oil wash fairly well, it is preferable to spray the bushes when they are still in the dormant stage.
Red Currant	Magpie moth, Aphid, Scales, Fruit borer	8 galls. ...	Winter	Do not spray later than in the first week of February, spray particularly the stems, not forgetting the under part of same.
Raspberry	Raspberry moth	8 galls. ...	Beginning of February	The fluid must also run along the stems into the ground, as just under the surface most of the young caterpillars are to be found spun in cocoons.

suitable varieties may be relied upon to produce plenty of good cobs, and these are invariably esteemed wherever good vegetables receive due appreciation. *Ralph E. Arnold.*

### HORSERADISH.

THIS much relished appetiser to our national dish—roast beef—is, curiously enough, not grown to any great extent in this country, and the needs of the market are largely dependent on imported roots. It is an excellent stimulant to the digestive organs, and owing to its diaphoretic and diuretic properties has other values in medicine. It is generally found in private gardens, but frequently under any but good conditions of culture, the roots simply remaining in the ground for an indefinite period, with the result that supplies consist of hard, stringy pieces difficult to grate, instead of young, succulent roots, full of natural juices yet less pungent in flavour.

It is a mistake to relegate this crop to an out-of-the-way corner as it needs an open situation and repays for good treatment. The plant grows especially well in light, rich, well-worked soil, and if the site is prepared thoroughly, thongs which are planted in the spring will yield roots of usable size the following autumn. In many cases, the plantation should be partially renewed every year, and if larger roots are wanted, a part may be left undisturbed the second year, after which the old plants should be discarded.

New beds may be planted in February, or so soon as the soil is in good condition. Choose clean, straight pieces of the root of about finger size or a little less, and cut them into sets about a foot long. These should be planted in rows in a slanting position, covering them to a depth of two inches. The sets may be planted at a foot apart in the row, but at least thirty inches should be allowed between the rows. The ground should be kept free from weeds at all times; in dry weather it is essential to keep a loose surface to check evaporation of soil moisture, as the plant soon suffers from lack of water at the roots. *W. Auton.*

## CULTURAL MEMORANDA.

### DEEP TRENCHING.

Few gardeners will, I think, question the wisdom of deep trenching for improving the soil and enhancing the appearance, quantity and quality of most vegetable crops.

Trenching is laborious work which, owing to a reduced staff in most gardens and the many necessary duties to be carried out, few are in a position to undertake.

The illustrations reproduced in Figs. 216, 217 in *The Gardeners' Chronicle*, December 18, 1926, in support of Mr. Beckett's remarks on deep trenching are very striking, to my mind a little too striking, as the plants in the untrenched ground look very thin in the rows and, if I mistake not, there appears to be some blanks amongst them which could not well be attributed to the want of trenching. The difference in size of the plants, however, compared with those in the trenched ground is very convincing, and entirely in favour of the latter operation.

I question, however, whether Mr. Beckett, who is a past master in the art of vegetable growing is quite right in his teaching when he advocates the bringing of the subsoil to the surface no matter what it is like. This may be correct in the case of London clay which his soil is mainly composed of, but there are various types of subsoil throughout the country. The kind I have to deal with is of a tenacious nature and of reddish colour, which comes, in places, to within one foot of the surface. Could such a subsoil be turned over to a depth of three feet and brought to the surface without detriment to future crops? I doubt it, except through a long process of trenching and retrenching, gradually deepening the trench each time to allow of the action of air, water and soil life on the broken subsoil.

It would be interesting to have the views of some of your experienced readers on this subject. *G. D.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Autumn Tints.**—I was much interested in the article by A. P. C. (p. 332, vol. LXXX), on Autumn tints, and also in your article on The October Garden, in your issue of November 13. The colouring of foliage in these gardens was unusual this autumn. Acers, to which we usually look for some of our best effects, were very disappointing: these include A. Ginnala, a number of forms of the Japanese Maple, Sycamores, and several forms of the Norway Maple. All of these were cut by the early frosts, the foliage turning a dull brown and persisting on the trees. Azalea foliage was late in colouring, but was a gorgeous sight ultimately. Amelanchiers were unusually good, but most of the Cherries were very disappointing. Rhus Cotinus, R. cotinoides, and R. typhina all failed to colour, the leaves being cut by frost. Oaks were exceptionally good in colouring, but the leaves came down very quickly, especially those of the Scarlet Oaks. Beeches, which with us usually carry their foliage through the greater part of the winter, were practically bare in late autumn, while the various species of Hamamelis were a total failure for colour. At the end of November trees of Liquidambar were still carrying foliage of a most glorious colour. Of berry-bearing plants, the only really effective one this season was the Pernettya, which was literally laden with fruits, and as these usually persist till March, I consider the Pernettya the best of all berried shrubs. *Evan G. Jones, Shalesbrook Gardens, Forest Row, Sussex.*

**Lathyrus tuberosus.**—According to Nicholson, this plant is found in Europe, West Asia, and North Africa, also that it is naturalised in Essex, while Benthams, in the *British Flora*, states that it is only found in this country around Fyfield in Essex, where it is abundant. In view of these statements, it is interesting to record that *L. tuberosus* was discovered last summer growing wild in a field adjoining Sedbury Park, Chepstow, the residence of H. Talbot, Esq. The plant was first noticed in a bunch of wild flowers at our local Tidenham Flower Show on August Bank Holiday, by Dr. Schoolbred, of Chepstow, a noted and keen botanist. Afterwards, it was only a matter of days before its habitat was found. I have heard that it is growing around Lydney, and perhaps some readers have found this charming subject in other parts of the country. It would be most interesting to learn if it has been found in other counties in addition to Essex, and this part of Gloucestershire. As the specific name suggests, it is tuberous-rooted, the perennial rootstock forming a few small tubers which are dormant during the winter months. The annual, tetragonal stems are weak, and if something to support them is present the plant will grow two or more feet in height, otherwise it will creep about after the manner of the Pen family in general. The flowers are neither so large nor so numerous in the spike as in the Everlasting Pea, but the colour is bright rose, or reddish, and altogether it is a delightful plant. There is no doubt it is worthy of being introduced to gardens, but until I know more about it, I would not advise placing it on the rock garden. Here it may prove too aggressive and become a veritable weed, but in other parts of the establishment it would probably keep within bounds, and be a source of joy during June, July and August. *T. W. Briscoe, Chepstow.*

**Cabbage Butterflies.**—Mr. Kenneth M. Smith, on the authority of other observers, dismisses (p. 412, vol. LXXX) Fabre's account of the egg-laying of *Apanteles glomeratus* as incorrect, and I assume, therefore, that he, as well as myself, has never observed the act of oviposition in that species. I should like to point out, however, that Fabre's account is so very circumstantial, that it is difficult to believe that he was entirely wrong. In his book on the *Life of the Caterpillar*, he states that he very wisely prefers to see things for himself than to take as correct what others have written, and accord-

ingly he collected the yellow cocoons of the parasitic fly and put each cluster in a separate test tube. He then collected batches of the larvae of the large white butterfly (*Pieris brassicae*), and put a cluster in a larger phial into which he introduced a batch of the flies, which had come out of the cocoons, and the flies took no notice of the larvae; on the contrary, when he introduced the flies into a phial with batches of the eggs of the butterfly, the flies clustered on the eggs and obviously oviposited in them. He describes the flies as black with pale red legs, and states that they came out in mid-June. It is, of course, possible that amongst the *Apanteles* were specimens of a chalcid parasite on *Apanteles*, but it would not lay its eggs in the butterflies' eggs, unless the latter already contained eggs of *Apanteles*. Egg parasites, of which there are many, especially amongst the Proctotrupidae, usually do their work so thoroughly that the eggs do not hatch and the perfect parasites emerge from them in due course. I firmly believe that Fabre describes what he saw, and the only possible way out of the difficulty appears to be the assumption that in some way or other, not at all easy to understand, the flies that Fabre watched ovipositing in the eggs were not those of *Apanteles* at all, but some other parasitic fly; yet one cannot believe that he could not distinguish between them. I have no wish to question the *bona fides* of Mr. Smith or the observers he quotes, but I shall certainly endeavour next season to settle the question for myself if I can secure *Apanteles* cocoons and ova of the butterfly at the same time. *C. Nicholson, F.E.S.*

**Apple Joy Bells.**—The well-timed comments of "T" on this variety (see vol. LXXX, p. 476) brings to memory a very enjoyable meeting I had with Mr. Will Tayler, and his presentation to me of a specimen fruit of the Apple he raised and named Joy Bells. I met Mr. Tayler at the first Imperial Fruit Show, held at the Crystal Palace, when, after an interesting chat on Apple lore, he produced a specimen fruit of a showy Apple from his pocket, inviting me to pass an opinion on the merits of its flavour. It was delicious, the texture of the flesh being soft, juicy and extremely sugary, reminding me of a well-finished fruit of James Grieve. I at once predicted a great future for this fine dessert variety. Mr. Tayler informed me that the tree was very fertile, made healthy growth and formed an ideal bush and a noble standard. It is especially productive trained as an espalier. *Pomona.*

**Biennial Cropping of Apples.**—Mr. William J. Moyse, on p. 37, criticising my remarks on biennial cropping of Apples, states that both my arguments support the theory that biennial cropping is natural. I did not mean to convey anything of the kind, for to say so would be quite contrary to my experience. This discussion started on whether the bad weather early in 1926 was responsible for the poor crop, or if it was the natural "off year." It is open to any grower as well as myself to note whether frost damages fruit blossom. A casual glance is of no use; one must look closely to see if the stigmas are injured, and it does not take more than a few degrees of frost to do injury. Mr. Moyse states that thinning does not lessen the weight of the crop. I should not call it "thinning" if it did not—and why should it be called an "artificial device"? A good Peach grower thins his fruit to one to every square foot of surface, so why should an Apple tree be expected to bear three and four times as many and yet retain enough vigour to bear a crop the following year. I know the usual method of thinning Apples is to leave the best one in every cluster, but that practice leaves far too many. Mr. Moyse's table on Apple cropping from 1906 to 1924 does not prove anything. There is no mention in it of what the weather was like when the trees were in flower. I advise him and other sceptics to try the "artificial device" of drastic thinning for himself and not depend on reports from Long Ashton or East Malling to support his arguments. *Grigor Roy.*

## SOCIETIES.

### THE ORCHID CLUB.

At the meeting of the Orchid Club held on the 14th inst., well-flowered specimens of fine varieties of *Cypripediums*, *Odontoglossums* and *Calanthes*, including several interesting and promising new hybrids raised by members, were shown extensively.

#### PREMIER DIPLOMAS.

*Cypripedium Chrysostom* var. *Lord Lambourne*.—From Dr. CRAVEN MOORE. A very fine variety of the well-known hybrid raised by G. F. Moore, Esq., of Chardwar. The round, dorsal sepal, four inches across, is white with a small green luna, and neatly marked with crimson spots. The well-proportioned petals and lip are green shaded with crimson.

*Cypripedium Perseus*.—From Dr. CRAVEN MOORE. A particularly fine, brilliantly-coloured flower of this well-known and beautiful variety, carried on a long stem, was awarded the Premier Diploma; the variety has previously been awarded the Diploma of Merit.

#### DIPLOMAS OF MERIT.

*Cypripedium Onward* (C. King George V. × C. Dixon Thorpe).—From A. T. CUSSENS, Esq. A medium-sized flower of almost perfect shape. The round, dorsal sepal is three inches across; it is white, with a small green luna; the ventral sepal, which is similar in shape and a little smaller, has a broad white band; the petals and lip are green shaded with brown.

*Cypripedium Memoria J. H. Walker* (C. Lady Dillon × C. Cardinal Mercier).—From Dr. CRAVEN MOORE. A medium-sized flower of good shape and beautiful colour. The square, dorsal sepal, three inches across, is white heavily blotched with crimson; the petals and lip are well-displayed and of good proportion, shaded with crimson on a yellow ground which appears as a clear yellow edge.

*Cypripedium Cloudelee* (C. *Monialis* × C. *Pallas* *Invincible*).—From F. T. PAUL, Esq. A new hybrid of excellent qualities somewhat marred by an unduly large lip. The dorsal sepal, three inches across, is white, with a small, yellowish-green luna, and spotted with crimson. The petals and lip are green shaded with brown.

*Cypripedium Charleworthii* var. *Merledene*.—From F. T. PAUL, Esq. A striking form of the species, having a large, flat, beautifully rose-coloured, dorsal sepal, three inches across.

*Calanthe Bessie Stewart* (C. *Bella* × C. *George*).—From B. J. BECKTON, Esq. A large, well-shaped flower of beautiful rose and white.

*Odontoglossum crispum* var. *Albatross*.—From Dr. CRAVEN MOORE. A hybrid crispum, having large flowers of excellent shape and great substance. The sepals and petals are pure white, the column red, and there is an occasional small red dot on the flat lip. The plant carried a full spike of fourteen open flowers and a second spike of twelve flowers and buds. A Certificate of Cultural Commendation was awarded to Mr. W. GILDEN, the gardener.

#### GROUPS.

B. J. BECKTON, Esq. (gr. Mr. W. A. Stewart), exhibited a highly decorative group composed of well-flowered *Calanthes* in great variety, including several plants of the dark crimson C. *Angela*, C. *Butterfly*, C. *Bella*, C. *Bryan* *superba*, C. *Chapmanii* and the new C. *Bessie Stewart*, raised at Daisy Bank. The many *Cypripediums* included such noteworthy varieties as C. *Warrior*, *Green's* var., C. J. M. *Black*, C. *Princess Patricia* and C. *Britain's Monarch*; whilst species were represented by various *Masdevallias*, *Restrepias* and *Leptotes*.

Dr. CRAVEN MOORE (gr. Mr. W. Gilden), staged a large and imposing group of *Odontoglossums* and *Cypripediums*. Of the former there were fine examples of the xanthotic crispums, O. *illustrissimum* *Shrubbery* var., and many blotched and white hybrid crispums of fine quality. The *Cypripediums* included C. *Chrysostom*, vars. *Lord Lambourne* and *Conyngham*; C. *Gwen Hannen*, vars. *excellens*, *Chardwar* and *virginale*; C. *Perseus*, C. *Corsair*, vars. *Holford's* and *Westonbirt*, and the new hybrid C. *Memoria J. H. Walker*.

Mrs. FRED HARDY exhibited *Odontoglossum*

*Mulstentaculatum*, carrying on a large, branched spike many of its sweetly scented, yellow and brown flowers. This interesting plant has been in cultivation at Tyntesfield since 1894, when it was obtained by the late Mr. Fred Hardy from his father's collection at Pickering Lodge.

Sir WILLIAM THOM (gr. Mr. R. Williams), had a selection of choice and interesting *Cypripediums*, including the beautiful C. *Athollii*, C. *Caractacus* var. *Carnival*, with a rich crimson blotched dorsal sepal and petals reminiscent of C. *Beryl*; C. Mrs. Rickards var. *cornutum*, a fine C. *Earl Tankerville* hybrid, a good form of C. *Cappa-Magna*, and the delicate yellow and white C. *Sanacderae* var. *Theresa*.

A. T. CUSSENS, Esq. (gr. Mr. Dalgleish), also staged an interesting group of *Cypripediums*, *Odontoglossums* and *Lycastes*, including two forms of the new C. *Onward*, C. *Olympus* var. *Diadem*, and *Lycaste Skinneri album*.

F. T. PAUL, Esq., F.R.C.S., showed a few select *Cypripediums*.

### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held at the R.H.S. Hall, on Monday, January 10, Mr. C. H. Curtis presiding.

Five new members were elected, five members withdrew interest amounting to £29 1s. 8d., and one member over the age of seventy withdrew £108 17s. 0d., while the sum of £38 5s. 11d. was passed to the nominee of a deceased member.

The Sick-pay on the Ordinary side amounted to £111 2s. 3d., and on the State Section to £117 0s. 10d.; maternity claims totalled £5.

The sum of £27 6s. 6d. was granted to State members towards dental and optical treatment.

### CARDIFF AND DISTRICT GARDENERS'.

THE fortnightly meeting of the above Association was held at The Queen's Hotel, Cardiff, on January 4, and was well attended. Mr. W. Jenkins, of Newport, read a paper entitled, "Opportunity." Mr. Jenkins dwelt on the many opportunities that presented themselves to gardeners, especially the younger ones, by belonging to the Association, and thereby making many new friends, winning prizes, making first speeches, and asking in public difficult questions. An interesting discussion followed Mr. Jenkins' remarks.

An interesting presentation was made to Mr. R. Mayne, one of the oldest members of the Association, of a case of amber and meerscham pipes and a tobacco pouch, suitably inscribed. This old and esteemed member has belonged to the Association for forty years, and held the office of Secretary for sixteen years.

It was decided to hold a dinner and social evening in connection with the above Association at The Queen's Hotel, Cardiff, on Saturday, January 29th, at 7 p.m. Donald Cory, Esq., will occupy the chair.

### READING AND DISTRICT GARDENERS'.

THE annual general meeting of this Association was held on Monday the 10th inst. The President, Mr. Frank E. Moring, occupied the chair and there was an excellent attendance of the members. The balance sheet and annual report, as read by the Hon. Treasurer and Hon. Secretary respectively, showed that the Association had enjoyed a prosperous year and was in a most flourishing condition. The membership had increased, the financial position was exceedingly sound, and the attendances at the meetings were large. Although the season was not so favourable as could be desired, the number of exhibits of flowers, fruit and vegetables staged at the various meetings amounted to one-hundred-and-seventeen. Among the officers elected for 1927 were: President, Mr. Frank Moring; Vice-Presidents: Mr. Alderman F. B. Parfitt, J.P., Mr. Leonard Sutton, C.B.E., Mr. E. P. Foquett Sutton, M.B.E.; Chairman, Mr. J. R. Lloyd; Vice-Chairman, Mr. H. Reeves; Hon. Treasurer, Mr. A. H. Leaver; Hon. Secretary, Mr. H. G. Cox, and Hon. Assistant Secretary, Mr. E. J. Dore. The Committee was also elected.

## Obituary.

**Arthur Abbiss.**—We regret to learn from *The Star* that Mr. Arthur Abbiss, of the firm of Messrs. Abbiss Bros., florists, Hitchin, was found drowned on January 15.

**Georges Hert.**—We record with regret the news, taken from the *Paris Revue Horticole*, of the death on December 13, of M. Georges Hert, a well-known horticulturist of Chesnay (Seine-et-Oise). M. Hert, who was only forty-six, had a brilliant career, first as a student at the Versailles Horticultural College, later acquiring fresh knowledge in Germany, and then becoming head of the glass department at Versailles, which he only left to found his own business at Chesnay. He leaves a widow and three children.

**Rev. F. Page-Roberts.**—The news of the death of this distinguished Rosarian will be learned with the deepest regret by our readers, for he was a well-known personality in the horticultural world and a warm-hearted man who had endeared himself to a wide circle of friends and acquaintances. He died on Wednesday, the 5th inst., following an attack of pneumonia. He commenced growing and showing Roses soon after he was appointed to the Rectory of Scole in Norfolk, in 1875. In the early nineties he removed to Halstead, and three years afterwards was appointed rector of Strathfieldsaye, where he had a fine Rose garden and excelled especially in the growing of Tea varieties. He was the President of the National Rose Society in 1909 and 1910. For a long number of years he was chairman of the Seeding Rose Committee of the N.R.S., and in recognition of his services to the Rose he was awarded the Dean Hole Memorial Medal in 1919. For many years the Rev. Page-Roberts was a member of the Royal Horticultural Society's Floral Committee. A portrait of the deceased gentleman appeared in our issue for February 6, 1926, accompanied by a short biography.

## ANSWERS TO CORRESPONDENTS.

**NAMES OF PLANTS.**—A. E. F. 1, *Aloe variegata*; 2, *Lonicera japonica* var. *sueo reticulata*; 3, *Santolina Chamaecyparissus* (*Lavender Cotton*); 4, *Mahonia Aquifolium*; 5, *Cotoneaster Simonsii*.—A. M. 1, *Ilex Aquifolium* (seedling form); 2, I. A. var. *latispina*; 3, I. A. var. *donningtonensis*; 4, I. A. var. *angustifolia*; 5, I. A. var. *ferox*; 6, I. A. var. *crispa*; 7, I. A. var. *scotica*; 8, I. A. var. *laurifolia*; 9, I. A. a. var. *flavescens*; 10, I. A. var. *Wilsoni*; 11, I. A. *platyphylla*.

**WHITE FLY FUMIGANTS AND PLANTS.**—G. S. (1) Cellular structure has little effect in rendering plants immune to the poisonous action of a fumigant. Whether the cells are thin or thick-walled, they have stomata or openings in them that can admit gases to the interior. The cellulose of the walls themselves may be regarded as so much dead matter after they take permanent form. The protoplasm or contents of all young cells are the deciding factors in the case, because protoplasm is the only real live part of a plant. In Tomato leaves it may be capable of resisting any particular fumigant by reason of some unknown factor which it possesses, but in *Chrysanthemum* leaves it lacks that factor which would make it immune to that same fumigant. A parallel case may be found in Potatoes which are immune and non-immune to wart disease. In the case of plants, the resistant ones are only discovered by experiments in the laboratory and out-of-doors. The resistant factor may be chemical or physical, or partly both. (2) If a fumigant was known, capable of killing white fly on *Chrysanthemums* and not the plants, it would soon be placed on the market. The white fly that is so destructive under glass is *Aleyrodes vaporariorum*. The outdoor one is *A. proletella*, which has a dusky spot on the middle of each forewing.

-pink, per doz. bun. ... 6 0-8 0	

REMARKS.—Daffodil Golden Spur is arriving in excellent condition, also a few boxes of Victoria and double Van Zions. Tulips are more plentiful and finer in quality; the varieties now include Couronne d'Or (double orange). More Iris tingitana has been on sale since Friday, and its price is high. Yellow Narcissus Soliel d'Or, mostly from the Channel Islands, arrives about three times weekly; supplies are somewhat limited and good prices are maintained. A few boxes of Grand Primo and Paper White Narcissus have been received in good condition. The supplies of Chrysanthemums are gradually lessening,

and very few coloured sorts are on offer. Lillium longiflorum and Richardias (Arums) were in shorter supply to-day, and prices are again firmer. A few L. lancifolium rubrum only are available. Snowdrops are the newest subjects in this department. All Roses are becoming scarce and poorer in quality generally. Larger consignments have been received from France during the past week, consisting mostly of Narcissus, Acacia (Mimosa), Marigolds, single Violets, Anemones and Ranunculus. A few Ulrich Brunner and Frau Karl Druschki Roses have been received in good condition. A more regular supply of Parma Violets has been received, and the prices of these flowers are more normal again.

REMARKS.—Business conditions are normal for the time of year, and although not a great volume of trade is moving, there is a healthy tone. Peaches, Apricots and Plums from South Africa are received in increased quantities every week. The condition of the fruits when they reach the market is, in most instances, satisfactory, and buyers are purchasing freely. The Apple market is quiet but restricted supplies have induced a better tone and prices have improved. A few fruits of home-grown Bramley's Seedling are selling well, although the price is somewhat high. Grapes continue to sell well in spite of competition with choice fruits from the Cape, and both English and Belgian Grapes are maintaining high prices. Forced vegetables, such as Beans, new Potatoes and Asparagus, are a fairly good trade, the first-named selling remarkably well. Beans from Madeira are scarce this week and realised good prices. Supplies of Mushrooms have been affected by the colder weather and are not so plentiful. Cucumbers remain scarce and dear. A few English Tomatoes are still available and find customers at an exclusive figure. Oranges, in response to a keen demand coupled with reduced shipments, are a firmer trade. Forced Rhubarb is more plentiful and its price is slightly lower. Green vegetables are inclined to be a better trade. Salads are popular, and supplies are moderately heavy. Trade in old Potatoes is good, with quotations stable.

## GLASGOW.

The conditions ruling in the cut flower market have undergone little or no change during the past week. Business continues quiet, and as supplies approximate to the trade demand, prices were well maintained. White Favourite is the only remaining variety of disbudded

Chrysanthemums now available and it was worth 1/9 to 2/- for 6's. Dunstable-grown sprays made 6d. to 9d. per bunch for Winter Cheer and Heston White, and 9d. to 1/3 for Favourite. Varieties of Tulips are becoming more numerous and representative. First consignments of Bartagon realised 2/6 for 6's, while prices for Prince of Austria varied from 1/6 to 1/9. Of other sorts, Rosebery and Vermilion Brilliant realised from 1/6 to 1/8; William Copland, 1/3 to 1/6; Couronne d'Or, 1/4 to 1/6; Murillo, 1/- to 1/6; and Thomas Moore, 1/- to 1/3. Golden Spur Daffodils found a ready sale at 1/3 to 1/6 per bunch (12's); Henry Irving averaged 1/6; Narcissi, 4/- to 4/6 per dozen; and Hyacinths, 6d. to 10d. for three spikes. The value of Carnations was lower again at 3/6 to 4/6 per dozen. White Lilac fetched 1/3 to 1/6 per bunch; mauve, 1/9 to 2/-; Mimosa, 8/- to 10/- per cane; and Violets, 1/- to 1/6 per dozen.

In the fruit market bitter Oranges advanced to 20/- per case, but Valencia fruit was 1/- to 1/6 per case lower for all counts, while prices of Jaffas favoured buyers at 14/- to 15/-. The prices of Blue Goose Grape Fruit fluctuated between 25/- and 30/-; Porto Rico, 23/- to 25/-; other marks, 25/- to 27/-. Apples were plentiful and cheap. Winesap being offered at 13/6 per case; Spitzbergen, 10/6 to 12/6; Newton Pippin, 12/- to 13/-; York Imperial, 18/- to 21/- per barrel; Greening, 24/-; Stark No. 1, 19/-; domestic, 16/6; and Canadian Baldwin No. 1, 24/-. Winter Nells Pears (Washington) averaged 23/- per case; Palermo Lemons (300's) realised 15/- to 16/- per case, and 11/- to 12/- per box; Murcia (300's) sold for 18/6. Mandarin Oranges realised 1/2 to 1/8 per tray. Almeria Grapes sold for 40/- per barrel and Rhubarb, 48/- per cwt.

## TRADE NOTE.

ADCO LTD., are acting up to their reputation for progressive business methods by sending a representative to the West Indies. The firm's horticultural adviser, Mr. W. Auton, is making the journey. His special business will be to visit those firms who are already using Adco in the preparation of organic manure and give practical advice and help in the most efficient methods of use.

The West Indies are well known as the centre of cane Sugar production, and indications are not lacking that the supply of organic manure in these islands is a problem of equal difficulty to that presenting itself in our own country. It is significant that the colonists—as the growing consumption of Adco shows—have tackled the problem in no half-hearted manner. Adco Ltd. are fortunate in having as their representative such a whole-hearted enthusiast as Mr. Auton, in the use of waste organic matter as manure, whose views on the subject have often been ventilated in these columns. Home producers must see to it that the colonists do not steal a march on them in grasping more readily the advantages offered in the direction of scientific manure production.

## THE WEATHER IN DECEMBER 1926.

The month of December was remarkable for the absence of anything approaching wintry conditions, especially the latter half, which was quite spring-like. Both temperature and sunshine were above normal, and the amount of rainfall was the lowest on record at this station.

The temperature mean maxima and minima were 44.7° and 35.9° respectively, giving a mean of 40.3° for the month. The highest maximum of 54° was reached on the 28th, and the lowest minimum of 28° on the 15th—an absolute range of 26°. The lowest reading of 22° on the grass also occurred on the 15th. There were sixteen days of ground frost. At one foot deep the soil temperature, with slight variations, was the same at the end of the month as at the beginning, viz., 40°, but the average was 38.4°.

Sunshine totalled 52 hours, a daily average of 1.67 hours and a percentage of 24. The brightest day was the 3rd with 5.8 hours, other dates with over five hours being the 20th and 29th. On six days blank cards were returned.

Only on six days did any rain occur, .07 of an inch on the 17th being the most for one day, while .21 of an inch represents the total for the whole month. A slight snowfall (which rapidly disappeared) took place on the 21st at 9 a.m. Air pressure was high throughout, the mean being 1.023 millibars, the greatest, 1.048 millibars on the 24th, being almost abnormal. Winds were chiefly from south and south-west, frequently fresh but never approaching gale force. There was no fog and visibility was mainly very good. William McClelland, St. Andrew's Provincial Training College Gardens, Mayfield, Dundee.

## GARDENING APPOINTMENTS.

Mr. E. H. Jenkins for the past three years foreman at The Rise, Llanishen, near Cardiff, and previously at Llenstaff Court, Ponty Clyn, as gardener to E. M. HANN, Esq., The Rise, Llanishen, near Cardiff.

## LEAF BLISTER ON PEACHES AND NECTARINES.

### "MEDELA"

THE fungus causing blister and curl of the leaves of the Peach, Nectarine and allied trees will be familiar to all gardeners. For this disease it is necessary to spray *before the buds open*, and the success of "Medela" as a specific for preventing attack has been its own recommendation, and it is only necessary to remind those interested to obtain "Medela" NOW, before the opportunity for spraying has passed. "Medela" should be diluted 1 part to 20 parts soft water. 1-quart cans, 3/6; ½-gallon, 4/6; 1 gallon, 7/-; 2 gallons, 11/6; 5 gallons, 25/6.

Carriage and Packing free.

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to advertisers of vacant situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

**LADY FLORIST** for seed and fruit and florist business; good designs; full particulars.—CROW, Florist, Chichester, Sussex.

## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.*

### SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required; but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid it will appear the following week, unless countermanded in the meantime.*

### MUNICIPAL AND PUBLIC.

**PUBLIC** or private, GARDENER or FOREMAN, life experience, Inside and Out, age 36. PACKER, Town Thorns, Rugby.

### PRIVATE.

## PRIMULAS & CYCLAMEN

During the next few weeks we shall have a particularly fine display of these beautiful flowers in the Glasshouses at our Experimental Grounds, Reading, adjoining the Great Western Railway, and about one-and-a-half miles east of Reading Station, on the Great Bath Road. The Houses which are illuminated at night are a great attraction to travellers on the G.W.R. Main Line to the West. All interested in these charming flowers are invited to visit the Houses while the display is at its best.

For Four years in succession, 1923-4-5-6, the Gold Medal of the Royal Horticultural Society has been awarded for Sutton's Cyclamens.

Complete descriptive lists of the best varieties of Primulas and Cyclamen will be found in Sutton's Garden Seed Catalogue for 1927. Post Free.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39.5°.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, January 26, 10 a.m. Bar. 30.0. Temp. 42°. Weather, Dull.

THE Conference on the Culture and Manuring of Sugar Beet, which was held at the Rothamsted Experimental Station on January 19, should, and we hope will, mark an epoch in the history of Sugar Beet growing in this country. Although a large number of extremely interesting facts were brought to light at the Conference, the one outstanding fact is that the average yield of Sugar Beet per acre in this country, after some three years of experience of growing it as a farm crop, is no more than eight-and-a-half tons per acre. The lowness of this yield is a natural source of anxiety to the Sugar Beet factories and should cause no less anxiety among all those interested in the cultivation of the crop; for, according to statements made at the Conference, if no increase of yield be made before the subsidy comes to an end, the prospect for the Sugar Beet industry will be of the gloomiest. It is certain that the most valuable work done at the Conference consisted in making clear to what this lowness of yield is due. It lies, apparently, not in the quality of the Beet, but in the method of cultivation, and there is, therefore, good ground for believing that when farmers gain more

experience in the cultivation of the crop they will be able to increase the yield by something like one-half as much again. A firm seed-bed, proper spacing of the drills and early singling of the plants are matters to which the farmer must devote more attention than he has done in the past. In the eastern part of England the drills are often twenty-two to twenty-four inches apart—a heritage from Mangold cultivation—and this width is, according to the best practice, far too great. It would seem from figures cited at the Conference, that the heavier yields which have obtained in the west of England are due to closer spacing of the roots. There is ample evidence also to show that the proper time for singling the plants is the earliest moment at which the operation can be performed. With respect to the subject of growing Beet on ridges or on the flat, opinion was divided; but we think that divisions of opinion may be harmoniously joined, if it be remembered that Sugar Beet is a plant which—both by its origin and its habits—requires a considerable degree of warmth during its growing period. We think, therefore, that the *mot d'ordre* should be "ridge on cold soils and flat on the warm." The very important subject of the manuring of the crops was also considered at the Conference, and it was extremely interesting to discover that not enough attention is yet given in this country to the time of application of fertilisers. Everyone who knows anything of plant physiology understands that the building up of the body of the young plant depends on an adequate supply in the soil of suitable nitrogen compounds, and that, therefore, and particularly in the case of a crop which has to be sown somewhat late after frost is no longer to be feared, nitrogenous fertilisers should be put on early. Potato growers have long since exploited this fact, and several farmers who attended the Conference claimed that by early application of nitrogenous fertilisers, sulphate of ammonia or nitrate of soda, for example, they had succeeded in increasing their yield, and declared, as we think, rightly, that they had no intention whatever of growing Sugar Beet without this cheap and effective aid to cropping. Of other fertilisers it appears that the supply of available potash in the soil is peculiarly important. Here again, experience is in accord with physiological fact, for it has long been recognised that potash plays a definite, if obscure, part in facilitating transport of sugar to the storage organs of plants. In the light of these facts, it seems to us undeniable that everybody concerned in disseminating agricultural knowledge should make an immediate and strenuous effort to induce cultivators to put these precepts into practice. That done, there will still be time to effect further progress in yield by paying attention to the breeding of varieties suitable for the different types of soil and climate of this country.

**The Controller of Horticulture.**—The news that Mr. Lobjoit is about to resign the office of Controller of Horticulture in the Ministry of Agriculture will be received with general regret. Mr. Lobjoit has occupied the position of Controller for some six years, and during that time has done a great deal to advance horticultural interests. The years during which he has held the office were, perforce, lean years, and we can well imagine that it will take a long time for Mr. Lobjoit, after his retirement, to get rid of the sound of the word "economy" ringing in his ears. On the retirement of Mr. Lobjoit, Mr. H. V. Taylor, who has acted with conspicuous ability as Mr. Lobjoit's deputy, is to assume control. Mr. Taylor, however, is to bear the title of Commissioner and not

of Controller; and we may be forgiven if we see here the thin end of the wedge of reaction. It was only after a long struggle that horticulture got itself recognised in the eyes of the Ministry of Agriculture as a craft in itself and not an elegant appendage to agriculture. Now, as we understand it, the rank of Commissioner in the Ministry is a subordinate one; and although, of course, all officers of the Ministry are subordinate to the Minister and the Permanent Secretary, that amount of subordination is, we think, quite sufficient for the healthy existence of anyone whose duty it should be to exercise forethought, imagination, energy and judgment in the interests of horticulture. We trust that our suspicions are groundless and that the chief representative of horticulture at the Ministry will continue to hold a rank which does not unduly subordinate him. Horticulture only won its present position at the Ministry after a sharp struggle, and could only have won it by justifying its claims in the eyes of the chief officials of the Ministry. During the years of Mr. Lobjoit's controllership it has done nothing to forfeit that goodwill. We may, therefore, hope that it will continue to enjoy it and that the office of Controller of Horticulture will be kept in existence as an outward and visible sign of the Ministry's recognition of the importance of horticulture and its distinctness from agriculture.

**A Big Flower Show for Blackpool.**—Doubtless stimulated by the great success achieved by Southport, Blackpool is arranging to hold an important flower show on July 20, 21 and 22, and as the energetic Corporation and townspeople are setting about the task of organisation with their usual zeal and enthusiasm, there appears to be no doubt that they will succeed in establishing another first-class flower show in this country. It is to be held in the new 288-acre Stanley Park, which was opened only last October by the Earl of Derby, and the close proximity of the Italian Garden and Rose garden, with the tennis courts, bowling greens, golf course, putting green, cricket ground and twenty-six-acre boating lake, will undoubtedly form an ideal setting for the show. Committees have been formed and several well-known horticulturists have undertaken to give the benefit of their experience. The Mayor of Blackpool is President, whilst Mr. A. Blackburn, Corporation Parks Superintendent, has been elected Show Manager, and Mr. W. Foster, Borough Advertising Manager, is filling the office of Secretary. The Schedule is in course of preparation, and already four trophies, value one hundred guineas, twenty-five guineas and twenty guineas (two) have been promised. The Mayor is issuing an appeal for further trophies and prizes, and there is every indication that a big number will be received. Exhibitors are to be offered every encouragement and facility.

**Retirement of Cologne Municipal Garden Director.**—After twenty-five years' service with the City of Cologne as Director of Parks and Gardens, Herr Encke has retired to his native town of Homburg vor der Höhe to enjoy a well-earned rest. Previous to his appointment in Cologne in 1903, he was for twelve years a professor of horticulture at the horticultural college at Wildpark, near Potsdam. For the parks and open spaces of Cologne good has certainly come out of the evil of the Great War. Previously, Cologne was a fortress, its growth and development cramped by the necessary girdle of fortifications. Now that these are being demolished by direction of the Allies, ample room is being found for a ring of open spaces which are fast developing according to the plans skilfully prepared by Herr Encke and his colleagues, and in which he will doubtless continue, in retirement, to take the keenest interest. Although sixty-five years old, he is still at heart a young man, and his friends are convinced that there are many years of happy and active life before him.

**A Successful Gardeners' Society.**—The Guildford and District Gardeners' Association has no fewer than 1,014 members, and thus constitutes one of the largest associations of its kind in the country. A social evening, held on the 13th inst., was attended by nearly two hundred

members. The President, Alderman W. T. Patrick, J.P., congratulated the Association on having enrolled over one thousand members and stated that Lt. F. W. Imms had accepted the office of show secretary, rendered vacant by the resignation of Mr. Tylecote last October.

**Trespass by Cattle.**—At the Windsor County Court, on Saturday, January 22, an action was tried in which compensation was claimed for damage caused to a garden by cattle. It appeared that while cattle belonging to a Slough farmer were being driven along the highway they rushed down a private road, broke a gate and fences and damaged the lawn in the garden of Mr. Joseph Barnett, of Eastville, Bath Road, Slough. For the defence, counsel argued that there was no case to answer, as it was a risk which owners of property adjoining the public highway must necessarily undergo. The judge agreed, and, holding that negligence on the part of the defendant had not been proved, gave judgment for him.

**Assault on a Well-known Nurseryman.**—At Wimborne, last week, a soldier was fined for having assaulted Mr. J. J. Kettle, the well-known Violet grower, at Corfe Mullen. In his usual public spirit, Mr. Kettle had lent, free of charge, one of his fields for the playing of a local football cup-tie and, naturally, made it a condition that the spectators should be confined to this field. A soldier was trespassing on another field, and when Mr. Kettle remonstrated, and pointed out the proper entrance, the soldier became very abusive and assaulted him.

**Dean Hole Memorial Medal.**—As will be seen on reference to our report of the annual meeting of the National Rose Society, the Dean Hole Memorial Medal has been awarded to Mr. C. C. Williamson, the retiring President. Mr. Williamson is a keen amateur rosarian, and his term of office has been marked by great progress in the membership of the Society.

**L.C.C. to Oppose the Covent Garden Market Bill.**—At a meeting of the London County Council, on the 25th inst., the Parliamentary Committee recommended that petitions should be presented against the Bill for the removal of Covent Garden Market. Dr. Scott Lidgett said he hoped the Council would formulate a scheme for retaining the Foundling Hospital site as an open space.

**Sweet Pea Annual.**—The members of the National Sweet Pea Society are well-served in the matter of their yearly publication, known as the *Sweet Pea Annual*, for it is one of the most interesting of all brochures published by the special floricultural societies. The *Annual* for 1927 is especially interesting in that it contains the prize essays selected from some twenty in competition for prizes offered by the Society. The first prize was awarded to the essay written by Mr. J. D. Dixon, Lyndhurst, Rotchell Park, Dumfries, who gives his experiences with Sweet Peas, and shows how his interest in the flower grew from his initial efforts in 1916, until he was successful in winning the cup for twelve vases in the competition for the blue ribbon of the local Sweet Pea world. Mr. Dixon tells the story of his success in growing his Sweet Peas in a very interesting narrative. The second and third prize essays are published in the *Annual*, also extracts from others. The frontispiece is an excellent portrait of Mr. J. M. Bridgeford, the President of the Society for the present year, and there are also portraits of Mr. W. Cuthbertson, who was awarded the Henry Eckford Memorial Gold Medal for 1926; Mr. F. T. Wheler, Chairman of Committee; and Mr. J. D. Dixon, who submitted the first prize essay. Mr. Cuthbertson contributes an article on "A Sweet Pea Show in California," and an illustration shows Mr. Cuthbertson amongst a group of noted growers of the Sweet Pea in America. The Floral Committee's report of the trials for 1926 is illustrated by several pictures, and there is the usual classifications list, the list of too-much-alike varieties, and the varieties especially recommended by the Floral Committee for general garden cultivation. In the audit of Sweet Peas, the variety Charming was included in 19 first,

17 second, and 11 third prize collections, at the annual show at Cheltenham, followed by Constance Hinton, in 18 firsts, 14 seconds, and 6 third prize sets; Powerscourt, in 14 first, 17 second and 9 third prize exhibits; Youth, in 16 firsts, 10 second and 8 third prize sets; Hebe, in 12 first, 7 second and 6 third prize collections; and Mammoth, in 11 first, 5 second and 3 third prize exhibits; thus showing these to be the six most popular exhibition varieties.

**Mr. H. T. Mason.**—The newly-elected President of the British Florists' Federation for the year 1927 comes from a family which has for many generations followed the cultivation of fruits, flowers and vegetables for the London markets. So soon as he had finished school, Mr. H. T. Mason maintained the family traditions by entering the same kind of business and gaining proficiency as a cultivator. In 1894 he established himself at Hampton and at first devoted his attention to the production of Strawberries,

MR. H. T. MASON.  
President British Florists' Federation, 1927.

vegetables and a few flowers, but his great love for flowers gradually led to an increase in the extent of their cultivation until now, with establishments at Hampton Hill and Thorpe Lee, Egham, the production of flowers amount to about nine-tenths of the whole business, the chief flowers grown for market being Carnations, Roses, Chrysanthemums and bulbous subjects. Mr. Mason's most important branch in fruit cultivation is the production of exceptionally fine Cox's Orange Pippin Apples for market. Ever since its inception, Mr. Mason has been a member of the Committee of the British Florists' Federation, and his elevation to the Presidency is a tribute to the high regard in which he is held by his fellow members, to his regular attendance at meetings and his quietly persistent efforts on behalf of the Federation and the flower-growing industry. Mr. Mason is an enthusiastic member of the British Carnation Society, was Chairman of its Committee in 1926 and is the President for 1927. He has not neglected local affairs as he was for twelve years a member of the Hampton Urban District Council. Now that he has three stalwart sons associated with him in his business he has some amount of leisure wherein to serve the several societies in which he is especially interested, and his many friends wish him health and a happy and useful year of office in the Presidency of the B. F. F.

**Tragic Accidents to Scottish Foresters.**—Two accidents, both of which ended fatally, occurred recently in the North of Scotland.

Mr. Charles Kerr, Kintessack Village, Morayshire, employed by the Forestry Commission, was engaged on the Culbin Sands cutting Broom with a shear-hook, when it slipped, and inflicted a severe wound on his left leg, between the knee and the ankle. He died three days later. Dr. Beaton, who attended Kerr, declares the wound was perfectly healthy, the cause of death, in his opinion, being due to pneumonia and heart failure, brought on by exposure and haemorrhage. The second tragedy occurred at Huntly, Aberdeenshire, on January 21. A number of woodmen on the Duke of Richmond and Gordon's estate were cutting trees in the Meadow Plantation. A large tree was being sawn through, and when almost finished, part of it broke away, and the workmen near got out of its course as speedily as possible. The other part of the tree which remained in the ground was slevered up to a height of about ten feet. One of the woodmen, Mr. James Gordon, Huntly, was standing near with axe uplifted to strike, when, all of a sudden, this part of the tree fell in his direction and, striking the axe as it did so, drove it several inches into the poor fellow's head. Death was instantaneous, for not only was his skull cleft, but it was fractured by the weight of the tree. Gordon was a highly esteemed employee on the Gordon-Richmond estates for many years.

**Birthdays.**—Very many horticulturists throughout the country will remember Mr. Thomas Manning who, for a long period of years, was general manager for Messrs. James Veitch and Sons in the spacious days of the old Chelsea Nurseries, and will be interested to learn that he celebrated his ninety-fourth birthday on Sunday, January 23, and is in good health. Another interesting personality is Mr. Peter Veitch, of Messrs. Robert Veitch and Son, Exeter, who celebrates his seventy-seventh birthday next week, and was present at the meetings of the Royal Horticultural Society and the Gardeners' Royal Benevolent Institution on Tuesday last.

**Gardeners' Royal Benevolent Institution Election.**—The eighty-seventh annual meeting of members and subscribers to the Gardeners' Royal Benevolent Institution was held at Simpson's, Strand, London, on Tuesday last, under the presidency of Mr. Leonard Sutton. Although the original arrangement was to elect twenty candidates to the benefits of the Institution, it transpired that two beneficiaries had died, and as the Committee were in a position to place two other candidates on the funds, the meeting agreed to the election of twenty-two candidates and the appointment of two others, making twenty-four in all. The successful candidates, with the votes polled, were: Mr. Walter Davis, 5,292; Mr. John Kitt, 4,763; Mr. Robert F. Sawford, 4,711; Mr. Fred W. Arnold, 4,158; Mrs. Ann E. Newell, 4,152; Mrs. Fanny Povey, 4,122; Mr. Henry T. Newman, 4,050; Mrs. Sarah A. Easey, 3,911; Mr. Henry Osman, 3,899; Mrs. Sarah A. Sheppard, 3,803; Mr. Henry Tedder, 3,752; Mr. Wm. H. Robbins, 3,628; Mr. Gilbert Sleep, 3,537; Mrs. Eilza Donovan, 3,522; Mr. Joseph W. Liddicoat, 3,320; Mr. Frederick Turland, 3,275; Mrs. Martha A. Woolford, 3,218; Mr. Walter S. Coleman, 3,155; Mr. Stephen Sedgwick, 2,953; Mr. Charles Blurton, 2,877; Mrs. Harriet C. Mansey, 2,877; and Mr. Henry W. Gray, 2,445. The two candidates placed on the pension list by the vote of the meeting were Mr. Uvedale Jones and Mrs. Elizabeth Milliner, each of whom had been unsuccessful during four elections. The forty-eight candidates polled a total of 115,376 votes. A full report of the proceedings will be given in our next issue.

**Scottish Sugar Beet Crop Returns.**—At the annual dinner of Fife Agricultural Society, at Cupar, an important statement relative to the development of the Sugar Beet industry in Scotland was made by Mr. A. Aitkin, Agricultural Adviser to the Anglo-Scottish Beet Sugar Corporation. In 1912 the maximum yield of sugar from Beet was 15 per cent., while last year the highest returns at the Corporation's six factories gave 24.3 per cent. of sugar. The

directors had shown their confidence in the farmers as growers by deciding to double the capacity of three of their factories, and they hoped before long to adopt a similar procedure at Cupar, where they had already signed contracts for 4,209 acres of Sugar Beet in 1927. They hoped soon to have 6,000 acres contracted for, and when they reached 8,000 acres the directors would seriously consider doubling the capacity of the Cupar factory. The Corporation made 35,000 tons of sugar from last year's crops and the acreage devoted to the crop in Scotland had increased from 8,000 tons in 1922 to 128,000 tons in 1926. At Cupar factory nearly 19,000 tons of Scottish Sugar Beet had been received.

**Phloxes as Bedding Plants.**—The perennial Phlox is one of the most valuable of hardy flowers and suitable either for the mixed flower border or for massing in large beds. The illustration in Fig. 40 shows a big bed in Hyde Park furnished entirely with Phlox Mrs. M. van Hoboken, a beautiful variety with large, soft, pink flowers, and of dwarf, bushy habit.

protection of the flora and agricultural crops was the Chestnut-bark disease. The disease had practically exterminated the native American Chestnut. As a direct result of the ravages of that disease, which came from the Orient, plant quarantine laws for the regulation of foreign plant importations were instituted in 1912, and two years later Canada adopted similar protective measures. The Blister-rust of Weymouth Pine was another serious forest disease which originated in Siberia and had existed in Europe for sixty-five years. Recently it had been found in British Columbia and the State of Washington, where it now threatened America's greatest White Pine resources. It had been found that Weymouth Pines were subject to little or no damage from rust if Black Currants were not growing within a mile, and no other Currants or Gooseberry bushes within nine hundred feet, so that by the elimination of the alternate plant host upon which the rust depended for its complete life cycle the very valuable White Pine might be preserved.

nurserymen for additional training. 7, Questions regarding the position of horticultural architects, protection of the title, etc.; 8, Application of the results of contemporary investigation into the laws of inheritance concerning practical (a) vegetable growing, (b) flower growing. 9, Inquiry into the conditions of the time of flowering and of fertility of fruit trees.

**Appointments for the Ensuing Week.**—MONDAY, JANUARY 31: Harrogate Horticultural Association's meeting. TUESDAY, FEBRUARY 1: Bolton Horticultural Society's lecture; Royal Caledonian Horticultural Society's meeting. WEDNESDAY, FEBRUARY 2: Nottingham and Notts. Chrysanthemum Society's meeting. THURSDAY, FEBRUARY 3: Manchester and North of England Orchid Society's meeting. FRIDAY, FEBRUARY 4: Accrington and District Chrysanthemum Society's meeting; Dundee Horticultural Society's lecture. SATURDAY, FEBRUARY 5: Blackburn and District Horticultural Society's meeting.

FIG 40.—PHLOX MRS. M. VAN HOBOKEN IN HYDE PARK.

The large bed illustrated was one of the attractions in Hyde Park last season. The ease with which the border Phlox is propagated and cultivated makes it everybody's flower, and few subjects give such a fine display over a long season for such little trouble or expense.

**Fungi as an International Problem.**—This was the subject of a paper communicated to the meeting of the Botanical Society of Edinburgh on Thursday of last week. The author, Mr. Glen Gardner Hahn, is a member of the Bureau of Plant Industry, United States Department of Agriculture, and is at present carrying out research work on forest-tree diseases with Dr. Malcolm Wilson in the Mycological Department of Edinburgh University. He pointed out that the economic conditions resulting from the international distribution of fungi were of such magnitude that they not only affected the agricultural resources of nations but the very lives and happiness of the people themselves. The one devastating disease more than any other which brought concerted action in America for the

**International Horticultural Conference in Vienna, 1927.**—The preliminary programme of subjects to be discussed at the International Horticultural Conference to be held this year in Vienna has been issued, as follows: 1 (a) International regulations for a nomenclature of novelties; (b) International agreements on granting certificates; Starting an international book of awards; (c) International agreement on uniform colour descriptions. 2, Horticultural experiments and methods of cultivation. Is it useful to annex institutes concerned with experimental horticulture to horticultural schools? or, is it desirable to leave the former independent? 3, Public horticulture; co-operation between the administration of the State and the administration of communities respectively. 4, Development of the present international committee for horticultural congresses into an International Office for Horticultural Congresses. 5, International agreements concerning commercial fruit trees, e.g., height of trunk, stocks, etc.; 6, Agreements on the organisation of the exchange of young

**"Gardeners' Chronicle" Seventy-five Years Ago.**—Mr. Warszewicz's *Orchids from South America*.—An arrival of Orchids, via Panama and Chagres, by the Clyde (after a rapid passage of thirty-nine days from Guayaquil) from Mr. Warszewicz, collected on the Cordillera of the Andes at Quindios, is advertised by Mr. Stevens for sale next week. From what we learn, and observe by the drawings and specimens of some, they appear to consist of Cattleyas, Odontoglossa, Oncids, and many other genera. But as Mr. Skinner, to whose charge Mr. W., as usual, has sent them, has not been able in his present family affliction, to attend to them, the catalogues will describe them fully when issued early in the week. We would only add that the very limited means at Mr. Warszewicz's disposal renders it desirable that gentlemen who are interested in his pursuits should do something on this occasion to assist him. He has been robbed in Guayaquil of one hundred dollars in cash, as well as his collections, and has now proceeded to La Paz, in Bolivia, without pecuniary resources. *Gard. Chron.*, January 31, 1852.

members. The President, Alderman W. T. Patrick, J.P., congratulated the Association on having enrolled over one thousand members and stated that Lt. F. W. Innes had accepted the office of show secretary, rendered vacant by the resignation of Mr. Tylecote last October.

**Trespass by Cattle.**—At the Windsor County Court, on Saturday, January 22, an action was tried in which compensation was claimed for damage caused to a garden by cattle. ## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley, Park, Bletchley, Bucks.

**Sophranitis grandiflora.**—The more forward plants of this most delightful Orchid have commenced to expand their scarlet flowers and will remain in bloom for a considerable time. This Orchid should be grown in quantity as the vivid colour brightens the cool house at this season considerably. Water should be given the roots whenever they become dry, as the plants are not capable of withstanding a prolonged season of drought. Repotting is best deferred until roots commence to develop from the immature pseudo-bulbs. This Orchid thrives best suspended near the roof-glass at the warmer end of the cool house, with a free circulation of air.

**Laelia pumila.**—This charming little plant is another that may have attention should the compost be decomposed, so soon as fresh root-action is evident. Many Orchids deteriorate through being allowed to remain in a decayed compost too long; it is much better to repot them than allow them to deteriorate for want of fresh rooting material. Osmunda fibre is the most suitable material in which to grow this Orchid, and shallow pans the best receptacles, as all these small-growing plants are best suspended so that they may be exposed fully to light and air.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTEER, Horsley Hall, Gresford, N. Wales.

**Early Potatos.**—Arrange to have a succession of new Potatos from plants grown in pots, heated pits and frames. The pots should be ten inches or eleven inches in diameter and well crocked. The compost for growing Potatos should be of a friable, open nature, consisting of loam, three parts, leaf-mould, two parts and old hot-bed or old Mushroom bed manure, one part. Sprinkle the materials with soot before mixing them. About half fill the pots with the compost and place three tubers therein and allow only one strong shoot to develop on each set; four tubers should be placed in each of the large-sized pots. Cover the sets with three inches of the compost, which should be only slightly firmed. A suitable place in which to grow these early Potatos is an early vinery or Peach house that has been started, for they do not need a high temperature. When the shoots have grown about eight to nine inches long a top-dressing should be given, and so soon as the new tubers have formed, a weekly watering with liquid manure will prove very beneficial. Choose early-maturing varieties, also those that produce short haulm. Where heated pits and frames are available for growing this vegetable, use a somewhat similar compost as recommended for pot culture. Plant each tuber at least twelve inches apart. When the top growth commences, endeavour to keep it as sturdy as possible and top-dress the roots when the haulm is sufficiently advanced. Water the soil sparingly until growth becomes active.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Gloxinias.**—If early flowers are desired, a batch of last year's seedling tubers may be started into growth. Place the tubers in boxes containing leaf-mould and sand and start them in a warm temperature. When they are growing freely place them in the receptacles they are to flower in. Gloxinias thrive best in a brisk temperature.

**Hippeastrums.**—Bulbs of Hippeastrums that have been resting for the past three months may be started into growth at will. It is not always advisable to start the whole of the plants at the same time, it being best to arrange for them to flower in batches at intervals. It is important in growing early Hippeastrums to select those that ripened their growths satisfactorily last autumn, and these, in all probability, will not require repotting, for this bulbous plant resents frequent disturbance at the roots. The selected plants should be well soaked in luke-warm water in order to wet the whole of the soil and roots thoroughly. After soaking them they should be turned out of their receptacles and the drainage put in order. Remove as much of the old top soil as possible without damaging the roots, and substitute a rich, sweet compost. These early plants will send up their flower stalks with more freedom if grown over bottom heat from a bed of leaves. With this treatment, very little water will be required at the roots until such time as the flower spikes begin to develop and some leaf growth is made. The whole of the collection will need attention within the next few weeks; should any plants require repotting, use as small a receptacle as possible. Seedlings raised last year and kept growing through the winter may require larger receptacles, and now or within the next few weeks will be a suitable time to repot them. Use a rich, open compost to which bone-meal has been added.

**Imantophyllum (Clivia).**—Plants that have been grown in cool conditions and on the dry side may now be watered and placed in more warmth to have them in flower at an early date. I strongly recommend arranging for a few plants to be divided and repotted each year; this will keep the collection in a healthy, flowering condition. Clivias flower best when the roots are restricted in a small space, and they must be fed liberally with liquid manure during their season of active growth. Seedlings raised last year should be kept growing and given more root space when necessary.

**Cinerarias.**—The earliest plants of greenhouse Cinerarias will soon be developing their flowers and now that their receptacles are filled with roots they will require examining frequently with regard to watering. Stimulants may be given more freely than hitherto and at an increased strength. If it is desired to hasten the development of the flowers, the plants may be grown in a somewhat warmer house than hitherto, but it should always be remembered that the Cineraria is a cool greenhouse plant. Later batches should be grown under cool conditions, using only sufficient fire-heat to exclude frost. Aphis should be kept under control by light fumigations or spraying with an insecticide on frequent occasions, until the flowers expand.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Plums on Walls.**—If the pruning and regulating of the branches of these trees have not yet been done, complete the work before the buds begin to develop. Established trees require much the same kind of pruning as the Cherry. Shorten all side-shoots of last season's growth and those not required for extension to within a few plump buds. If the walls are not yet completely furnished with the tree, allow the leader to extend quite twelve to fifteen inches at each year's pruning until the whole of the space is filled. The finest Plums are generally produced on two-year-old wood, therefore a few young shoots should be retained at intervals and secured to the walls where there is room between the older branches. See that the ties and fastenings do not compress the shoots and that the nail heads do not come in contact with the bark, as both may cause gumming. Trees that have borne freely for several years should be given a top-dressing of suitable compost after removing some of the exhausted surface soil. All young trees growing too strongly

to be fruitful should have their roots lifted and replanted, mixing plenty of lime rubble with the staple.

**Orchard Trees.**—Trees in orchards should be pruned more or less annually. Any which may have been neglected and become crowded with useless wood should be thinned of some of the branches before the buds are far advanced. Remove all interlacing branches and spray wood in the interior parts of the tree to allow light and air to enter freely. Two operators should undertake the pruning of large trees, one on the ground to direct the pruner as to which branches to remove. After the pruning is finished, remove all the prunings from the ground and, in suitable weather, spray the trees with an alkali wash or some other suitable specific. The old practice of dressing the trees with lime is to be recommended if the stems are covered with lichen, etc. American blight has been very prevalent here during the past two or three seasons, notwithstanding repeated dressings with various specifics. I have not used carbokrimp but hope to do so this season.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Figs.**—If the trees are in pots and the latter plunged in bottom-heat, a mean temperature of 75° should be maintained by turning the fermenting materials on frequent occasions and adding fresh dung and leaves as is necessary. The roots should be fed with clear diluted liquid manure warmed to 80°. As growth proceeds, pinch the shoots at the fifth or sixth leaf, remove all useless spray growth, and tie such shoots as are necessary to make a well-balanced head. The temperature in later houses containing trained trees which have been started should be increased to 60° on mild nights, and 70° to 75° by day with sun-heat. Water the roots with water warmed to 80° and syringe the trees regularly. Keep late houses cool by ventilating freely; the starting of the trees into growth will be governed by the absence or presence of fire-heat. Short, stout pieces of wood with good terminal buds may now be inserted as cuttings; remove the lower bud to prevent suckers from developing and plunge the pots in bottom-heat.

**Winter Cucumbers.**—The mild weather of early January was highly favourable to the development of Cucumbers without the aid of excessive fire-heat. Autumn-raised plants are looking extremely well and will no doubt give a good supply of fruits when they will be most valuable. The syringe may be used more freely for damping the walls and other available spaces in bright weather, but guard against damping the pipes when they are very hot. The plants should not be pinched too hard for the present, but the shoots may be stopped at a joint in front of a fruit promising to swell. Young shoots may be trained in thinly and divested of superfluous female and all male flowers. By daily attention to small details including feeding the roots with warm, diluted liquid manure and applying light, rich, top-dressings as often as the roots appear on the surface, insects and mildew will make no progress, and although the growth may be a little weak for some time, it will be fresh and healthy. The bottom-heat should range about 65° to 70° at night, and 75° to 80° by day, the maximum amount of warmth to be obtained with sun-heat.

**Spring Cucumbers.**—Stout, young plants are of great importance, and with more light and sun-heat a greater amount of moisture may be given the young plants that were planted on mounds of soil. Pinch out the points of the shoots when they reach the top of the trellises and stop the lateral shoots at each first or second joint, as they continue to grow. Protect the plants at night from cockroaches until they are well-established, and do everything to encourage the young plants to grow. Cover the roof-glass with mats in severe weather. Sow more seeds according to requirements and germinate them in a temperature of 65° to 70° and a bottom-heat of 75°.

## THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Liliums.**—Complete the work of planting Liliums so soon as possible, for the bulbs suffer quickly if left exposed to the air for some considerable time. If, for any reason, it is impossible to plant the bulbs, they should be laid in boxes or trays and kept covered with leaf-soil or fibre, or, if desired, they may be placed in pots and planted in their permanent quarters when they have started into growth. If this is done, they should be stood at the foot of a wall and covered with leaf-soil or fibre. In growing Liliums free drainage is one of the most important cultural details, and if the soil is not well drained, special sites and compost should be prepared for all but the very easily-grown species and varieties, such as *L. Martagon* and its varieties, *L. Hansonii*, *L. croceum*, *L. umbellatum*, *L. chalcedonicum* and *L. elegans* and its varieties all of which will succeed in a medium, well-drained loam. *Lilium auratum* and its varieties should be grown in a stony, well-drained compost free from lime, while many of the smaller and choicer species, as represented by *L. rubellum*, *L. japonicum*, *L. Parryi*, *L. Grayi* and *L. Farreri*, enjoy a light compost mixed with plenty well-decayed leaf-soil; in a light, free soil. *L. Farreri* extends by underground stolons and soon makes a perfect mat of growths. In planting Liliums it is important to surround the bulbs with plenty of clean, sharp sand. Where a collection of Liliums is grown, the stock should be maintained by means of seedlings, or, failing seeds, scale leaves should be used as a means of increase.

## FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Adiantums.**—The present is a suitable time to repot many kinds of Ferns, which are usually grown in a warm house. Where the system of resting one half of the stock of Adiantums has been followed, the crowns of the rested plants are bristling with young fronds, a sure sign that root-action has commenced. If large specimens are desired, either for exhibition or house decoration, and the pots they are occupying are large enough, it may be sufficient to remove a quantity of the surface soil and substitute a compost of good loam, leaf-soil, sand and mortar-rubble. If, however, the plants are still in comparatively small pots they should be shifted into receptacles that will permit of at least one inch of soil being firmly placed round the existing ball of roots, using similar compost to that recommended for top-dressing. Increase of stock is readily accomplished by dividing the plants into small pieces and placing the latter in three-inch pots; these small plants will be found very useful for furnishing the front of the stages, etc. During the growing season, when the pots are again well-filled with roots, frequent applications of diluted liquid manure and soot-water will favour the development of dark green, luxuriant foliage.

**Leeks.**—Where large Leeks are desired during the early autumn, seeds should be sown now in a box containing rich soil, and germinated in a temperature of 50° to 55°. Cover the seeds at least a quarter-of-an-inch deep, a little more will do no harm, and so soon as the seedlings appear keep them as sturdy as possible by exposing them to the light. When the second leaf is developing the plants should be pricked out singly, either in small pots or in boxes of good soil, about three inches apart, from which a selection of the strongest may be made later, and potted up according to requirements. Keep the young plants growing steadily without a check by transferring them to larger pots as necessary until planting time, which is usually towards the end of May, when they should be transferred to well-prepared trenches. It is important in the young stages to keep the plants erect by means of small stakes.

**Brassicas, etc.**—Make sowings of the various members of the Brassica family, either in cold frames or in boxes in a cool house, and among these, Brussels Sprouts for early use, early and late Cauliflowers, and early and late Cabbages are the most important. Sow the seeds very thinly, as the vitality of the young plants is quickly decreased when they are crowded in the seed-box or bed; black-leg and damping-off diseases would be less prevalent were this rule always observed. So soon as the seedlings are showing their first pair of leaves they should be pricked out into good soil in cold frames and grown on sturdily until the time for planting arrives, when they may be lifted with good balls of soil and roots and planted in their permanent quarters. Sowings of Lettuces and Parsley may also be made under similar conditions to provide early supplies of these vegetables.

**Fruit-houses.**—Vineries in which fire-heat is not used should be closed in order to give the plants as long a season of growth as possible. These houses, having been cleansed and made ready and fully ventilated, may require damping each day in bright and sunny weather, but do not saturate the border at this stage. Once the ventilators have been closed they should not be opened again unless the temperature rises

FIG. 41.—SYRINGODEA PULCHELLA.

above 95°, which is not likely to happen in northern gardens until near the end of March, by which time the young growths will be well-advanced, and air may be admitted as found necessary.

**Seed-sowing.**—It is early yet for sowing many kinds of flowers, but those which are known to require a long period in the seed-pan before the seedlings are ready for pricking off may be sown first. Among other plants raised from seeds sown at this time are Begonias, Gloxinias and Gesneras. Care is necessary with these minute seeds to ensure that they are not covered deeply and that they are equally distributed over the surface of the soil in the pot or pan. Probably the best method with small seeds of the kinds mentioned is to fill the pan in the usual way, provide plenty of drainage, and after making the surface firm and smooth, to water the pan liberally, and when the soil is still moist to sow on the surface, completing the work by pressing the soil firmly again. If a further covering is desired the surface may be covered lightly with silver sand, but as most growers cover their pans of small seeds with glass and paper this is not absolutely necessary.

## BULB GARDEN.

## SYRINGODEA PULCHELLA (Hook.).

This delightfully dainty little bulbous plant is a member of the Natural Order Iridaceae or Rainbow Flowers, and takes the place in South Africa of the Crocus of the northern hemisphere. Some eight or nine species are known, all of which are confined to South Africa, mainly on the mountains of the more arid districts of Cape Colony. The species under consideration (*S. pulchella* (Fig. 41), grows in short grass in open, exposed, rocky places, on the Sneew Berg, Graaff Reinet Division, Cape Colony, at various elevations up to 4,500 feet, and is subjected to over 20° of frost for short periods in its native habitat, so should require but little protection in the south of England.

The root-stock is a globular corm about half-an-inch in diameter, with a thick, dull brown skin. The leaves, which number from four to six, are extremely slender, in fact, almost bristle-like, and from three to five inches long, curving gracefully outwards, overtopping the flowers. One or two beautiful blossoms are produced from the centre of each tuft of bristly, deep green leaves; their tubes are slender, as much as two inches in length, slightly curved or perfectly straight, very pale lilac in colour. The perianth is deeply divided into six wedge-shaped segments each being notched into two lobes at its tip, and are of a pale purple or lilac tint. The anthers are yellow and the filaments white. The blossoms, when fully expanded, measure from three-quarters to one inch across.

The corms should be planted during the month of March in the rock garden, in the sunniest spot available, in a pocket of rich, well-drained, sandy loam, covering them with about two inches of soil; they require plenty of water when in full growth, and should not be allowed to become dust-dry when at rest. A sheet of glass placed overhead when the corms are at rest will help to ripen them and give some protection from severe weather.

*Syringodea pulchella* is a very charming subject for the alpine house, where its fragile blossoms last longer in a decorative condition than they do in the outdoor garden. A. W. D.

## BOG GARDEN.

THE beauty and interest of a water garden is greatly enhanced by a well-kept grass bank in which may be planted at intervals of a few feet such bog and moisture-loving plants as *Senecio clivorum*, two-and-a-half feet; *Iris aurea*, four feet; *I. Monspur*, four feet; *I. Shelford Giant*, five to six feet; *I. orientalis*, four to five feet; *I. Kaempferi*, in many shades of beautiful colours, three ft.; *I. Pseudacorus* in yellow and white, four to five feet; *Lythrum Rose Queen*, four feet; *Astilbe Arendsii* in variety; *A. Davidii*, *Spiraea Aruncus*, *S. venusta*; *S. gigantea*, from three feet to six feet (a very effective plant); *Trollius* in variety; *Mimulus*, in variety; *Saxifraga peltata*, with large, bronzy, peltate leaves and corymbs of white flowers (a very showy waterside plant); *Rodgersia podophylla*, a handsome foliage plant, the large, peltate leaves on stout stalks, three feet high, assuming a coppery-bronze colour with age; *Gunnera manicata* and *G. scabra*, both handsome plants with gigantic leaves on stout stalks; *Primulus* in variety; also the Royal Fern, *Osmunda regalis* in variety, and *Nephrodium* (syn. *Lastrea*) *Thelypteris*, both pretty waterside Ferns.

Many may venture on the hardy *Cypripedium Calceolus*, *C. pubescens* and *C. macranthum*, and hardy species of Orchids and *Habenaria* for the more shady parts; these Orchids grow splendidly in damp peat and sand.

There is an abundance of grass-like plants and Reeds which are indispensable for the bog garden and waterside planting. They give a tropical effect to the surroundings, especially the taller Bamboos, which do well when planted in positions sheltered from high winds. W. L.

## FLOWER GARDEN.

## SWEET PEAS.

If not already done, Sweet Peas should be sown in pots or boxes for planting out in beds or borders, or for planting in the reserve garden for furnishing a supply of cut flowers. The seeds should be dressed with red-lead, or protected in some other way from the attacks of mice. The ground in which the seedlings are to be planted should be prepared now, if not already done, and the addition of good loam is very important in the case of poor, sandy soils. Sweet Peas, sown out-of-doors during the autumn, should be protected from sparrows and slugs; they should also have some timely support, small sprays of Hazel being excellent for the purpose.

## RANUNCULUS.

ALTHOUGH the corms of *Ranunculus* may be planted during the autumn, I have always found it best to defer planting them until the beginning of February, unless the garden is in a very favoured part and the soil light and warm.

The beds or borders should be well-drained, and in cold, low-lying situations should be raised above the general level. It is an advantage to have the beds or borders dug and well manured some time before planting. The claw-like roots should be set carefully about four inches or five inches apart in drills made about three inches deep. On cold, heavy soils it is advisable to surround the roots with clean, sharp sand. *Ranunculuses* are usually offered in three sections, viz., Persian, French and Turban varieties, and while they are all beautiful I have found the French varieties most useful for furnishing cut flowers, and am surprised the plants are not more generally grown for this purpose. J. Coult.

## TWO PRETTY BEDS.

ONE of the most charming effects I noticed in the flower garden last spring was an oval bed of *Phlox canadensis*, interplanted with Darwin Tulip Farncombe Sanders. The rich scarlet flame-colour of the Tulips towering above the light green foliage and Plumbago-blue flowers of the *Phlox* appealed strongly to me. The Tulips seemed to be in graceful harmony with the slender, though abundant growth of the *Phlox*.

Another artistic combination of flowers I observed last season was provided by planting *Kniphofia aloides grandiflora* with *Galtonia candicans*, both autumn-flowering subjects and highly attractive when planted in bold groups. The scarlet pokers blended beautifully with the bell-shaped, snow-white flowers of the *Galtonias*.

For an autumn display both these flowers may be planted during the early spring, and they will revel in good, sandy loam. Plant the *Galtonias* four inches deep and nine inches apart. W. L.

## HARDY FLOWER BORDER.

## SCHIZOSTYLIS COCCINEA MRS. HEGARTY.

*SCHIZOSTYLIS coccinea*, the Kaffir Lily, is a handsome Iridaceous plant, a native of South Africa, and valued because, when planted in a suitable position, it produces its scarlet coloured flowers in the late autumn and winter.

The variety under notice is even more beautiful than the type, the flowers being of a delicate pink colour, and larger.

The plant succeeds well in a warm, well-drained, south border, and is suitable for planting at the foot of a wall.

Propagation is readily effected by dividing the plants in spring, and planting portions, each having five or six shoots, in well-prepared soil at a distance of nine inches apart. A liberal amount of peat or leaf-mould should be included in the soil, which should be a rather sandy nature.

When the flowers are developed to perfection they are valuable for use as cut blooms. T. H. Everett.

## ALPINE GARDEN.

## TOP-DRESSING ALPINES.

MANY alpine plants are benefited by an annual top-dressing of fine soil worked in among the shoots, and this may be applied now. The compost used should be of an open, gritty character, for if composed of close, heavy materials, it may cause many plants to damp off.

Pockets of worn-out soil should be refurnished with fresh compost, and positions prepared for special plants; many rock garden plants have roots out of all proportion to their top growth, and such plants require a deep root-run; a depth of three feet is not too much for many of them. The compost in which such plants are grown may be composed very largely of small stones and gritty material, which nearly approximates to their natural conditions, and conserves moisture much longer during dry weather. J. C.

## EUONYMUS KEWENSIS.

It is believed that this curious little shrub is a very dwarf form of *Euonymus radicans*, but as it does not appear to have flowered, that point must remain somewhat obscure.

*E. kewensis* is, at any rate, quite unique. It seems to be naturally prostrate, making a close-set tangle of leaves and branches no more than a couple of inches in height, though it will sometimes mound itself into a conical heap of leaves and stems. But if it is within reach of a convenient rock or other small shrub some of its branches will often ascend these, thus showing a propensity to climb.

The foliage is evergreen, and the ovate leaves of a dark green relieved by veinings of a lighter shade. These are about half-an-inch long and half as wide; the margins are a little decurved and often slightly toothed. Fortunately, this interesting plant seems to be quite hardy in a light, stony soil. It was introduced by Sargent from Japan in 1893. J.

## INDOOR PLANTS.

## GARDENIAS.

THESE useful shrubs, with deep, shining green leaves, the flowers of which are so delightfully fragrant and valuable for hand and buttonhole bouquets, should be grown wherever accommodation can be found for them.

*G. florida* and its varieties, *Fortunei* and *radicans*, are well-known and are the best for supplying cut blooms. They require a stove temperature and thrive in an open compost consisting chiefly of fibrous loam and peat. The plants should be repotted annually until they have attained a large size, when every other year will suffice.

Young plants produce the finest flowers, but large, old specimens are more valuable for the production of blooms in quantity, and should be grown so long as they can be maintained in health and vigour.

A moist atmosphere and frequent syringings during the growing season are essential details of cultivation. The plants should be kept free from mealy-bug and scale insects, to the attacks of which they are very susceptible.

By growing plants in successional batches they may be had in flower during most of the year without great difficulty. Propagation is effected by cuttings of young shoots taken with a heel, inserted in sandy soil and rooted in brisk bottom-heat.

## EUCHARIS AMAZONICA.

THIS lovely *Amaryllid* is one of the most beautiful of all white-flowering plants, its large, glistening, wax-like flowers standing out with remarkable refinement.

Although it may be had in flower at almost any period of the year with judicious management, it is as a winter-flowering subject that it claims most attention. To have it in perfection during the winter it is necessary to grow the plants on in a brisk temperature during the summer, when they should receive liberal supplies of water and enjoy the advantage of

an abundance of atmospheric moisture. When growth is completed in late summer they may be given somewhat cooler conditions for a month or two and kept rather drier at the roots, but not so dry as to cause flagging. This will give the plants a good rest and when they are again afforded more heat and moisture they will soon begin to throw up their flower spikes and remain in beauty for a considerable period.

A suitable compost for this *Eucharis* consists of three parts good, fibrous loam and one part rotted manure, with sufficient sharp sand to render it porous.

Propagation is effected by division of the bulbs, which increase rapidly under generous treatment. The *Eucharis* is susceptible to the attacks of scale, mealy bug and thrips, but the broad, smooth leaves make it comparatively easy to keep them free from these pests. The most injurious pest is the *Eucharis* mite, but under good cultivation this seldom becomes a serious menace to the plants. A. P. C.

## FLORISTS' FLOWERS.

## THE MODERN SINGLE CHRYSANTHEM. MUM.

At exhibitions where single *Chrysanthemums* are shown well the visitor is first attracted by the variety *Molly Godfrey* and its forms *Bronze Molly*, *Red Molly* and *Susan*. Then, perhaps, *Phyllis Cooper* and *Sandown Radiance* appeal next, and after these such sorts as *Mrs. W. J. Godfrey*, *Mrs. T. Hancock*, *Reginald Godfrey* and *Isabel Felton* for their large size. Others like *Catriona* have too prominent centres or discs, and others may appear to have been made single by pulling away superfluous florets. The most perfect of all, those of the *Mensa* type, have somewhat small flowers with discs out of proportion. If the above estimate of popular exhibition single *Chrysanthemums* be correct, there is considerable room for improvement. The system of stopping the points of the plants in spring is prevalent with growers, and this has undoubtedly contributed to the defects that have been mentioned, more particularly the one of the flowers coming too double, and another which has not been named, i.e., the foliage near the bloom developing over large. Many of the flowers of single varieties, if from early buds, will throw blooms that are nearly double.

A successful method of growing singles is to root the cuttings in January or February and, when ready, pot the plants in pairs, and subsequently treat them as one plant. The growth is allowed to develop and branch at will and then thinned according to the size of the pot the plant is finally grown in. From the one branching there is usually a sufficiency of stems to carry from eight to a dozen blooms to a pot. It is found that the central branches of certain varieties develop too much vigour and when thinning is done it is well to begin with these extra strong shoots, which not only furnish comparatively coarse blooms, but prevent the others from growing evenly.

The shoots of many single varieties grown in a natural way rise to a considerable height before the bud, which is followed by branching, forms; and when this occurs the grower looks forward to the next bud, as being near the terminal, and it is then he anticipates securing the more characteristic flower. The best kind of growth is that hardened by firm potting, allowing the plants plenty of space through the season and feeding them moderately with stimulants.

From the aspect of the cut-flower trade, the singles have, with few exceptions, been wanting in substance of floret, and thus this type of the flower has been not nearly so much in evidence for market purposes as improved varieties are likely to be in the future. *Phyllis Cooper* and *Sandown Radiance* have both been very popular with florists, and the introduction of *Absolute* brought perfection somewhat nearer.

This and *Laddie* are remarkable for the lasting quality of the blooms although they are a trifle small. If the size of these single *Chrysanthemums* was improved and the colours more varied they would become very popular with the general public. H. S.

AUBRIETIA—CARTERS ROSE  
QUEEN. Very clear and contains  
no suggestion of magenta. Height,  
4 ins. Per pkt., 1/6

DAHLIA—CARTERS GOLIATH.  
Tall double flowers of the new,  
popular decorative type. Height,  
5 ft. Per pkt., 1/6

FORGET-ME-NOT — CARTERS  
AZURE BEAUTY. Exceeds all  
other dwarf forms. Height, 6 in.  
Per pkt., 1/6

GENISTA ANDREANA—  
CARTERS HYBRIDS. Colours in-  
clude crimsons, scarlets and brown  
in combination with yellow and gold  
shades. Per pkt., 1/- and 1/6

MIGNONETTE — CARTERS  
GOLDEN MONARCH. A new  
giant-flowered golden form of this  
fragrant annual. Height, 1 ft.  
Per pkt., 1/6

PENTSTEMON—CARTERS  
IMPERIAL HYBRIDS. We have  
adopted the name Imperial owing  
to the regal colouring of the red,  
purple and scarlet shades. The  
majority of the blooms have white  
throats; very free-flowering.  
Height 2½ ft. Per pkt., 1/6

## (VEGETABLE SECTION)

PEA CARTERS GOLIATH. The  
largest podded, blunt-ended tall type  
yet introduced. Height, 5 ft. Wrinkled  
seed. Per pkt., 1/-; ½-pint, 2/-;  
pint, 3/6; quart, 6/-.

PEA—PROGRESS. A very fine  
new First Early. Rich dark green,  
broad pointed. Height, 15 ins. Wrinkled  
seed. Per pint, 2/6; quart, 4/6

CELERY—CARTERS MONT BLANC.  
A dwarf-growing early variety. Very  
solid heads of remarkably fine texture.  
Per pkt., 1/6

**Carters**

WALTHAM CROSS HERTS.

If you are not familiar with the wonderful  
results obtained with Carbokrimp in the  
Official Trials on Winter Washes, write to:

The Technical Adviser  
Geo. Monro Ltd.

Hertford Road, Waltham Cross.

This wash will destroy the eggs of Aphis,  
Psylla, Winter Moth, etc.

If you cannot obtain supplies from your  
Local Seedsman, write direct, sending us  
his name.

## KNAP HILL NURSERY WOKING, SURREY (Late Anthony Waterer)

The Executors of the late  
**HOSEA WATERER**  
have pleasure in offering

## HARDY RHODODENDRONS

for general purposes.

Without doubt the finest stock in the trade.

Named varieties, 2 to 6 and 8 ft.

AZALEAS in great variety, 2 to 5 ft.

HARDY HEATHS, in variety

### GOLDEN YEWS

A Magnificent Stock in all shapes and  
sizes from 2 to 10 ft.

PRIVET, common and oval-leaved.

QUICK and HORNBEAM, for Hedges,

## STANDARD TREES

in great variety, consisting of

LIMES, NORWAY MAPLES, ELMS, Etc. Etc.

EVERGREEN & DECIDUOUS SHRUBS, viz.

Box, green and variegated, 3 to 8 ft.

Hollies, Common, 5 to 8 ft.

" Variegated and green  
varieties, 2 to 6 ft.

Thuopsis borealis, 10 to 12 ft.

Cupressus Lawsoniana, 12 to 14 ft.

Cedrus atlantica glauca, very fine, 14 to 16 ft.

Osmanthus, Phillyroceas, Spiroceas,

Lilacs, Viburnums.

and a good general nursery stock.

Catalogues ready.

Inspection invited when it will be found  
well worth a visit.

## TREES AND SHRUBS.

## THE FLOWERING ASH.

The Flowering Ash (*Fraxinus Ornus*) is a beautiful tree when in full bloom, and I have often wondered why this very ornamental subject is not more widely grown. In some districts it may be fairly plentiful, but in others it is few and far between. As a specimen tree *F. Ornus* is very imposing; the single stem carries a dense, rounded mass of branches from within a few feet of the ground to a height of some fifty feet. The leaves, like the bark, are much like those of the Common Ash. The large flower panicles, which appear in spring at the ends of the young shoots, and which suggest those of a *Spiraea*, are white and very fragrant.

*F. Ornus* was introduced from Italy about 1730 as *Ornus europaea*. It is deciduous, apparently quite hardy and grows freely in a warm, free soil. It is said to be very satisfactory as a town tree. The practice of grafting this species on the Common Ash has led to disappointment, owing to suckering, and one feels convinced plants raised from seeds would be infinitely more successful. A.

## SOPHORA TETRAPTERA.

This yellow-flowered, evergreen shrub, which is sometimes known as *Edwardsia grandiflora*, has proved to be among the hardiest of the New Zealand subjects grown here. It loses many of its dull green, pinnate leaves in winter, but the wood has not yet been injured. The flowers of the type are up to two inches long, but in the variety *grandiflora* they are at least four inches long. They are followed by curious "necklace" pods, and the seeds occasionally ripen here.

A remarkably pretty variety, or sub-species, is *S. t. var. microphylla*. This is a most elegant shrub, the slender, reddish branches bearing much smaller, more rounded leaves of the fresh, cool green of a Maidenhair Fern. Thus far, this form has not flowered here, but it is a more rapid grower than the foregoing which, for over fifteen years, has not exceeded a height of about four feet. A. T. Johnson, Ro Wen, Conway, North Wales.

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Continued from p. 70.)

## CASHEW AND AVOCADA PEAR.

SOME travellers have reported that the Cashew tree has the stone outside the berry, but what is generally believed to be the fruit is in reality a fleshy, eatable stalk two inches to four inches (5 to 10 cm.) in length, which contains a sweet, astringent juice, and may be either red or yellow in colour. The real fruit is a kidney-shaped nut at the end of this stalk. The kernel of this nut may be eaten after the thick, black, caustic oil (cardol) which it contains, has been expelled by heat. For this purpose the fruit is roasted, after which the kernel is easily extracted. The latter is very delicious; in taste it reminds one of Hazel nuts.

The Avocado or Alligator Pear, *Aguacate* in Spanish (*Persea gratissima*, Gaertn.) is locally called "Pear" for short. It is cultivated throughout tropical America, from sea-level to an altitude of 6,500 feet (say, 2,000 m.), and in the island of Ruatan a wild species is found. The tree reaches a height of forty feet to sixty feet (12-18 m.); it has small white blossoms and oval-shaped leaves which, when young, are purple in colour.

The Avocado tree bears a Pear-shaped, green fruit (Fig. 42) with a large, round, oily seed in the centre, which separates readily from the firm pulp. The latter is white or yellowish in colour; it has the consistency of butter and contains abundant greenish oil. It is eaten after the addition of a little salt, or it is served as a salad. The Avocado is a very rich food and should find great favour with vegetarians. In the Bay Islands the fruits ripen in August and September, but, unfortunately, they do not keep long. Small quantities have been exported to the United States, where they are highly esteemed.

There are several varieties differing in size, shape and quality, the red or purple sorts being inferior to the green ones. Of the latter, I have seen some weighing so much as four pounds.

## GUAVA.

The Guava, or Guyaba (*Psidium Guajava*, L.) grows as a bush or small tree, reaching eight feet to ten feet (2.50 to 3 m.) in height, and is found both in a cultivated and in a wild state. It is easily propagated, needs no care, and is hard to kill. In some regions of Central America large areas are covered with this tree, which form a real jungle, the seeds having apparently been transported by birds; such places are known by the name of *Guyabales*.

The flowers are white in colour and have a very pleasant scent. The cultivated Guava fruit is about the size of a small hen's egg; it has a thin, smooth, yellow skin and a strong scent. The two most common varieties are the white or Pear-shaped one (*P. G. var. pyri-*

FIG. 42.—AVOCADA PEAR (*PERSEA GRATISSIMA*).

ferum), and the red or globular variety (*P. G. var. pomiferum*). The former is the larger, and has a thinner skin; its yellow pulp is less acid than that of the red, thick-skinned variety. The latter is not much cared for; its pulp becomes red upon nearing maturity, but the skin remains yellow.

The pulp of the Guava is of a sub-acid flavour and may be eaten raw, but is said to cause indigestion in this state. It is also made into preserves for local consumption. The perishable fruit is not suitable for export, but from Cuba and Jamaica the well-known Guava jelly is exported to the United States and to England. When not fully matured the fruit is said to be an efficient remedy for diarrhoea; a decoction made from the boiled leaves, bark and roots is also used for the same purpose.

The Guava tree sheds the outer layers of the bark in large pieces, which curl into tight rolls and finally drop off. The wood is very strong and durable, but as the tree is very crooked and gnarled, it is of little value commercially; locally it is much esteemed as firewood.

## SOURSOP AND ROSE APPLE.

The Soursop or Guanabana (*Anona muricata*), is the fruit of a small, tropical American tree with small, shiny, lanceolate leaves. The large fruit may weigh from two to five pounds (1 to 2½ kg.); it has a green skin which is covered with soft prickles. Many large brown seeds are embedded in the white pulp. The latter is very soft and juicy, slightly acid, but of agreeable flavour; it is much used in the making of ice cream and *refrescos*. Several parts of the tree have medicinal properties.

The Rose Apple or Manzana Rosa (*Eugenia Jambos*) is the fruit of a large tree with spreading branches, and long, narrow, evergreen leaves introduced from the East Indies and the Malay Islands. The small, round, sweetish fruit is yellowish in colour and has sometimes red cheeks; it resembles a small Apple and has a strong Rose-like fragrance, hence the name. It is claimed that the stone in the centre is poisonous, and that under certain circumstances a single one may cause the death of a person. The greenish-yellow or greenish-white blossoms are arranged in bundles. The young leaves are at first purple in colour, but soon they become green. The tree is propagated from the seeds. *Eduard Conzemiuss, 33, Boulevard des Batignolles, Paris.*

(To be continued.)

## ROSE GARDEN.

## NEW ROSES IN AMERICA.

AN unusual number of new Roses are being offered in America this season. While these are all primarily forcing varieties, it is entirely probable that they will also succeed out-of-doors if given suitable conditions. Perhaps the most sensational variety of the present spring is *Rapture*, from Messrs. Traendly and Schenck, a prominent firm of Rose-growers in Connecticut. This is really a much intensified sport of *Madame Butterfly*, pink with a satiny sheen, shaded orange at the base of the petals. Being a sturdy grower, this will undoubtedly put *Madame Butterfly* out of the running as a forcing Rose here. It is no doubt the finest novelty of the year.

*Tottys' Red*, from Messrs. G. H. Totty Co. Maddison, New Jersey, is the richest sport of *Premier* yet seen; the colour is crimson-scarlet, being really more crimson than scarlet. *Florex*, from the *Florex Gardens*, South Wales, Pa., is another lovely novelty; the colour is rich coral salmon. The plant produces long, strong shoots, but the bloom is rather weak in petalage. *Fontanelle*, a seedling of that most popular of all yellow Roses in America, i.e., *Souvenir de Claudius Pernet*, is not so good in colour as its parent, but flowers much more abundantly. *Roselandia* has been grown to some extent, but is too small.

*Columbia* is rapidly losing favour as a forcing Rose on account of so many of the flowers coming "bull-headed"; *Briarcliff*, one of its sports, introduced last year, has been heavily planted and lacks the defects of its parent. It is the most popular of this particular colour here. There is also one named *Silver Columbia*, of paler colour, which is quite popular. Mrs. F. R. Pierson, a red sport from *Premier*, introduced in 1926, is meeting with a somewhat mixed reception; it appears to come very variable in colour and be rather too much subject to black spot; when well-grown, however, it is beautiful. Another novelty of the present season is *Premier Supreme*, of a very deep rose-pink shade; it has long, pointed buds and is a robust grower.

*Madame Alexander Dreux* has attained some favour as a forcer; the flowers are small, but the extreme richness of the blooms have caused it to be an excellent seller. It is only being handled in a moderate way compared with other Hybrid Teas.

*Souvenir de Claudius Pernet* is easily the leader amongst yellows here, both for forcing and outdoor culture. Fancy, long-stemmed flowers for Christmas trade realised \$75.00 to \$100.00 per 100, wholesale, a price which was equalled by *Templar* and surpassed by *American Beauty*, the latter realising \$200.00 per 100 with four feet stems. W. N. Craig.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 8, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 8, Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## ADONIS GARDENS IN SCRIPTURE.

MANY interesting details in relation to the Gardens of Adonis were of necessity omitted from the article on this subject a year ago.\* To one of these omissions it is proposed to devote the present paper, viz., that which relates to the references to the Gardens of Adonis in the Hebrew Scriptures. To many it will, probably come as a surprise that any such allusion should be found. Thanks, however, to the intensive study of the Bible, and classics of legend and myth during recent years, many new things have been brought to light. The comparative study of religions and traditions in the languages of Assyria and Egypt, of Greece and Rome, as well as of Sanskrit and other tongues has shown, not only that similar ideas prevailed among the different races of the Old World, but also that as they came into closer contact with each other they discovered many things of a religious nature which they shared in common; and as ages of intercourse went by each assimilated from the other some point of mutual interest. Thus there grew up a very mixed religion or mythology, and it is often exceedingly difficult to disentangle the mass.

Hence it came about that the Jews, to the great grief of their prophets and leaders, introduced into their religious ceremonies many usages which were in vogue among their so-called heathen neighbours. From among many which are well-known to all students of Hebrew lore we are able to select that which relates to the worship of Adonis. In the authorised version of the Old Testament we read (*Isaiah* xvii, 10): "Because thou hast forgotten the God of thy salvation, therefore shalt thou plant pleasant plants, and shalt set it (i.e., the garden) with strange slips." If, now, we turn to the Revised Version, and read the marginal notes, we shall find this: "Because thou hast forgotten God, therefore thou plantest plantings of Adonis, and settest it with vine slips of a strange god." The earlier expositors found in these words a general allusion merely to Jewish apostasy. As Bishop Lowth remarked: "The pleasant plants and shoots from a foreign soil are allegorical expressions for strange and idolatrous worship; vicious and abominable practices connected with it; and reliance on alliances entered into with the neighbouring nations."

\*See "Classical and Legendary Gardens" in *The Gardeners' Chronicle*, February, 1926, p. 136.

Naturally they overlooked the specific reference which later researches have brought to light. As Professor Cheyne observes, the ordinary rendering of the words, as found in the text of both the authorised and the revised versions, does not give a suitable contrast, nor does it suit the context. If it be objected that in the Hebrew text the name Adonis does not occur, the answer is that epithets, such as 'the pleasant one,' or 'the holy one,' often took the place of the name of the deity, which may have been tabooed; and so in this case Naaman, the pleasant, stands for a divine title. Ewald was the first, apparently, to see this, and the question then arose—What strange god is represented under this epithet? Now Naaman is the Hebrew equivalent of the Arabic *Noman*, which is not only a proper name, but also the name of the river Belus, which was the headquarters of the cult of Adonis. Further, the name for the red Anemone in Arabic is *shakaiku-n-noman*, which scholars interpret as 'the wounds of Adonis,' and from which some assert that the name of the Anemone is best derived. Similar names for the so-called "blood-plants" are to be found in all tongues, and corresponding legends respecting their origin. As to the origin of these names, recent researches into the operations of the primitive mind lead us to be sceptical of the usually received interpretations; but into this we are unable now to enter.

If, then, the phrase "pleasant plants" or "plants of Naaman" is to be taken figuratively, we shall read with Cheyne: "therefore thou didst plant plants of Adonis" or Gardens of Adonis, and vine slips of a strange god. In the *Encyclopaedia Biblica*, indeed, Professor Cheyne goes further than he did in his *Isaiah Commentary*. "The N. Israelites were at this time (he says) specially open to Syrian influences. They forgot Yahwe because he seemed unable to protect them. So Isaiah indignantly exclaims: 'Therefore, though thou plantest (little gardens with) shoots of Adonis, and stockest them with acions (dedicated) to a foreign god . . . the harvest shall vanish in a day of sickness and desperate pain.' The phrase, 'shoots of Adonis,' he adds, points to the so-called 'Gardens of Adonis,' baskets containing earth sown with various plants, which quickly sprang up and as quickly withered. In reality they were symbols of the life and death of Adonis; but Isaiah takes the withering as an image of the withered hopes of Israel."

Cheyne finds here a trace of the worship of Adonis or Tammuz, which is even earlier than those found in Jeremiah and Ezekiel. As these are intimately associated with our subject it will be necessary to give them a glance. We read in *Jeremiah* (xxii, 10) that the people were not to raise the dirge "Ah my brother! or Ah sister! They shall not lament for him saying Ah lord!" which in Hebrew is literally "Ah Adon!"—a word from which many philologists assert that the name Adonis is directly derived. The reference in *Ezekiel* (viii, 14-18) is to Tammuz and the Tammuz-cult, and this is nothing other than the cultus of Adonis, as was recognised so long ago as the days of Jerome and other early Christian fathers. Adonis was a Syrian idol, say the old authorities, whose worship was celebrated in the temple of Venus at Byblus. To give one illustration: Lucian informs us that Adonis was slain by a wild boar, in memory of which the Syrians "every year (at the celebration of his festival) beat themselves and lament, and celebrate frantic rites (literally 'orgies'); and great wallings are appointed throughout the country; and after they have beaten themselves and lamented they first perform funeral obsequies to Adonis as to one dead, and afterwards on another day they feign that he is alive and ascended into the sky"—and more to a similar effect, from which account a tolerably good idea may be formed of the manner in which the Jews who had turned to idols lamented Tammuz.

There has been some confusion in the various accounts which have come down to us respecting the period of the year when the festival of Adonis was celebrated, as well as the period spent by Adonis in the nether world. This is due to

the fact, alluded to above, that traditions from such different peoples as the Assyrians and Phoenicians, Egyptians and Greeks have been blended; so that Istar and Tammuz, Aphrodite and Venus, Osiris and Adonis, to mention no others, are terribly confused the one with the other. It is, therefore, of interest to note that Ezekiel specifies the month and day. It was in the sixth month and the fifth day of the month, which would correspond with the festival which, according to some, was regularly held in July. But, owing to the confused reports which have come down to us the Adonis festival was said to have been celebrated at different seasons of the year.

In order to understand our subject thoroughly, we must go back beyond the days of Plato, who mentions the Gardens of Adonis in his *Phaedrus*, as we shall see later, and examine the records of ancient Babylonia. It is among the early mythological poems which the Babylonians have bequeathed to us that we find the most primitive known form of the legend which was familiar to the Jews, and formed the basis of the rites alluded to in Ezekiel. This Babylonian poem, as Sayce informs us, recounts the descent of the goddess Istar into Hades in search of the healing waters which should restore to life her bridegroom Tammuz or Dumuzi, the young and beautiful Sun-god, the counterpart of the fair Adonis. This poem will be found translated and annotated in the Hibbert Lectures by Professor Sayce, who remarks that it throws light upon certain passages both in the Old Testament and in classical authors, and in turn receives light from them.

"On the one hand (he adds), we now know who was that Tammuz in whose honour Ezekiel saw the women of Jerusalem weeping at the gate of the Lord's house. On the other hand, it is clear that the Tammuz and Istar of the Babylonian legend are the Adonis and Aphrodite of Greek mythology. Like Tammuz, Adonis, the beloved one of Aphrodite, is slain by the boar's tusk, but eventually ransomed from Hades by the prayers of the goddess. It has long been recognised that Aphrodite, the Kyprian goddess of love and war, came to Hellas from Phoenicia, whether or not we agree with Dr. Hommel in seeing in her name a mere etymological perversion of the Phoenician Ashtoreth. Adonis is the Phoenician *Adoni*, 'my lord,' the cry with which the worshippers of the stricken Sun-god mourned his untimely descent into the lower world." Here we may refer again to the passage from Jeremiah, which Sayce renders: Ah me, my brother, and ah me, my sister! Ah me, Adonis, and ah me, his lady! An echo of this is found in *Æschylus* the earliest of dramatists, in his *Agamemnon* (line 121): "Cry *Ælinon*, *Ælinon*!" In Homeric times the chant was attributed to a supposed Linos, but in reality the Greek word *Ælinos* is a Phoenician cry, *Ai-lenu*, meaning Alas, for us! and with these lamentations the dirge at the Death of Adonis was wont to begin. *Hilderic Friend*.

(To be concluded.)

## HORTICULTURAL PRODUCE ACT.

THE Horticultural Produce (Sales on Commission) Act, 1926, which has just come into operation, is a measure every gardener should become acquainted with, for, as its title indicates, it was passed to regulate the sales on commission of garden produce.

Section one provides that where horticultural produce is sent to a salesman for sale on commission, he must enter in a book kept for that purpose, the name of the owner or sender, the names of the buyers and the price that has been obtained. And so soon as possible after the sale he must send to the owner or consignor an account containing the following particulars:—

- (a) The actual price paid for the produce, and where there is any variation in price, the number, weight or quantity sold at each price.

(b) The commission or charge he makes for selling, and also details of any charges he makes for services connected with the sale, and

(c) The amounts (if any) he has paid or will have to pay for the owner or sender in connection with the sale and details of such payments.

Further, if on any such sale the salesman or someone for him, buys the produce, this fact must be stated in the account.

Section two of the Act provides that the owner or sender of such produce may, within ten days, of the receiving of the account above referred to, require the salesman to produce the records and books in his possession so far as they relate to the sale, and if the salesman refuses to do this he makes himself liable to a fine of twenty

### NOTES FROM A WELSH GARDEN.

Few winter-flowering shrubs can compare with *Lithospermum rosmarinifolium*. Given fair weather conditions—and it is by no means fastidious in that respect—this lovely *Lithospermum* will be covered with its enormous sapphire blossoms from November to spring. The colour of these charming flowers is almost exactly that of *Gentiana sino-ornata*, and the corollas are often over an inch across. This season has dealt kindly with *L. rosmarinifolium*, for though we have had 10° to 12° of frost on several occasions the plant has not suffered injury.

*Rosmarinus prostratus*, which grows upon the cliffs of Capri along with the above, is not more

of berries, whilst *C. pannosa*, which I referred to last month, is even better than it was. *C. Simmondsii* is another reliable winter-fruiting species. Although a familiar and cheap shrub, it is very beautiful at this season, whether grown as a bush against a wall or as a hedge. Since it produces its berries on the older wood, even along the main stems and branches, clipping or pruning may be carried out without spoiling the prospects of berrying. Being rigid and sparse in habit, *C. Simmondsii* is first-rate on a wall, as a support for light climbing plants such as Clematises, *Mutisia decurrens* or *Maurandia Barclayana*.

Another berrying shrub which is very delightful at this time of year is *Gaultheria procumbens*, the only member of the genus grown here which retains its fruit during winter. It is

FIG 43.—A FINE PLANT OF *CYPRIPEDIUM NITENS LEEANUM* VAR. *BECKTONIAE*,

Awarded a Cultural Commendation by the B.H.S. Orchid Committee on the 11th Inst. Shown by Mr. John Evans (see p. 56).

pounds, as he does if he fails to comply with the provisions of section one of the Act.

Section three of the Act, which is the "interpretation section," defines horticultural produce as "vegetables, fruit, flowers and plants," and further provides that produce consigned for sale shall be deemed to have been consigned for sale on commission unless, before the sale:—

(a) The salesman has received from the owner or consignor a direction in writing to the contrary, or

(b) The owner or consignor and the salesman have made an agreement in writing to the contrary.

It is also provided by sub-section four of section one that the provisions of the Act are not to apply to a sale of horticultural produce unless the owner or consignor sends to the salesman before the sale an advice note specifying the nature and description of the packages consigned and their contents. H. S.

hardy here than its compatriot, which is saying much for the latter, since this delightful Rosemary is generally considered robust enough for most places. A more charming rock garden shrub than *R. prostratus* I have yet to meet. It is, of course, a spring bloomer, but plants in sheltered places are often flecked with pale bright blue even at this date.

Though *Coronilla glauca* often does admirably near the sea in North Wales, it is apt to be badly damaged by frost in this garden, and my shrubs, though now blooming, are still suffering from the effects of last winter.

On a new piece of wall which needed draping speedily, the foliage of *Vitis (Cissus) striata* is singularly fresh and cheerful at this season. The small, evergreen leaves are elegant and abundant and of a soft olive-green. Though only planted late last spring, this pleasing little Vine has made nearly five feet of growth, and it looks like doing all that was expected of it, and that quickly.

Though we have had spells of severe weather, *Cotoneaster frigida* is still carrying a good crop

an ideal woodland carpeting subject and is equally pretty when it adds its waxen pinky-white blossoms to its foliage of reddish stems and deep green leaves.

The above *Gaultheria* and *Polygala Chamaebuxus* var. *purpurea* I should place very high in any list of lowly, ground-covering shrubs for partially-shaded places. The Milkwort appears to thrive in the driest of soils, though it may take some time to become established, and I know of no better carpeter for the taller Heaths. Here it is rarely out of flower, but as few plants show greater variation in blossom and leaf than this *Polygala*, growers should choose one of the best forms. *P. Vayredae* and *P. hebeclada* (syn. *rhodoptera*) are very much smaller plants with narrower leaves, and flowers of a brighter purple, and too choice for such carpeting purposes, but there are few tiny shrubs more worthy of a good place in the rock garden.

In part-shaded woodland, *Hacquetia* (*Dondia*) *Epipactis* has begun to show the mustard-yellow of its closely-clustered heads of little flowers before even the Winter Aconites have

appeared. But, though so precocious, this plant continues in bloom for a long while, for instead of spending its energies on an outburst of bloom, its flowering is conducted in so cautious and leisurely a manner that it will still be in bloom when spring has arrived.

Growing close-by the foregoing is *Cyclamen neapolitanum*, the large, rich green, Ivy-shaped, leaves of which are marbled and clouded with emerald and silver. This excellent autumn-flowering species is well worth growing for its leafage alone, for it is one of the most charming objects of the winter garden. *C. Coum*, here, usually sends up its rounded, fleshy, deep green leaves in the later autumn. These, which in the true plant have no trace of marbling, are soon followed by the dainty flowers in a deep carmine-crimson, and the latter will appear off and on the winter through. *C. Coum album* is especially dainty and delightful, looking like a Persian *Cyclamen* in miniature; it was peering forth amid the Ivy of the woodland floor early in January.

A good form of *Erica carnea* is always a great attraction at this season, and I doubt if there is another winter-flowering shrub of equal merit. It is so hardy, so indifferent to the worst of weather even when in flower, and so amenable to cultivation under widely differing conditions of soil, that it can surely claim to be not only the best of our winter-blooming shrubs but one of the most beautiful and useful subjects ever introduced to gardens. Yet this superb species is not grown to anything like the extent it deserves to be. A very unique variety of *E. carnea* appeared two or three years ago. It seems to have come to us from a Dutch nursery and is called *Vivelli*. Very much dwarfer than the type, this curious form has foliage of a deep, sombre green, inclining to bronze at the tips in winter. The flowers, which are freely borne from early January onwards, are a good deal darker in tone than those of any other variety. In some lights they appear to be approaching blood-crimson.

*Helichrysum Selago* is always more noticeable at this season than at times when there is more blossom about. It is a stiffish, upright bush, of about eight inches, the branches, with their closely-set, scale-like leaves, being suggestive of some Club-moss, or plaited whipcord in green and grey. Our specimen has been growing unprotected in a dry, sunny spot for many years and has never suffered any injury from frost. It occasionally blooms, the small white flowers appearing in summer towards the tips of the branches.

*Euphorbia Wulfenii* is a very ornamental plant during autumn and winter. It makes a massive clump some three to four feet in height, the stout, pale green stems terminating in bunchy heads of long, narrow leaves whose somewhat glaucous green is suffused with a soft plum-purple, thus making a most attractive shade of colour. The pale yellow, terminal inflorescences appear in early summer and often remain into autumn; they are decorative but not particularly appealing. But as an evergreen bush *E. Wulfenii* is always worthy of a place in gardens. It does not object to shade, and should have some protection from harsh, rough winds. *A. T. Johnson, Ro Wen, Conway, N. Wales.*

## GARDEN NOTES FROM SOUTH-WEST SCOTLAND.

SHRUBS and herbs that flower out-of-doors in midwinter claim and receive special esteem from gardeners and amateurs. Among the hundreds of species—new and old—of *Rhododendron* that have come to us from the Far East, there are many that surpass *R. Nobleanum* in brilliance; but as I stood to-day, January 13, before a large bush of this old hybrid, with its hundreds of crimson trusses in glowing contrast with a sombre background of leafless woodland, methought it was a sight as satisfying as may be had in these dark days. The original cross, *R. arboreum* × *R. caucasicum*, was made in 1850, and is a truly fine thing of goodly stature. Unluckily, that cross has since been several

times repeated, and one is now very apt to be supplied with plants inferior both in size and colour to the true *R. Nobleanum*, which seems to have become scarce in the trade. Probably *R. Nobleanum venustum* (not to be confused with the later-flowering *R. venustum*, syn. Jacksoni, of the same parentage as *R. Nobleanum*, reversed) is also *R. arboreum* × *R. caucasicum*. It bears its bright pink flowers throughout the winter months, and deserves to be more frequently planted than it is.

It is well-nigh fifty years since all other species of *Witch Hazel* were eclipsed when Maries sent home *Hamamelis mollis* from China, nearly fifty years ago. It was long before the quality of this plant became generally recognised, nor does one even now meet with it in cultivation as often as one should. I know of no shrub that flowers with more regularity and profusion, let the character of the winter be what it may. A well-furnished plant, ten feet high, with all its sprays set with innumerable golden stars, is a cheering object about the New Year. It may be well to note that nurserymen usually propagate this species by grafts on the far inferior *Hamamelis virginiana*, which, after the reprehensible manner of stocks, is prone to send up growths of its own to the notable detriment of the scion. *Hamamelis mollis* still may claim rank as a novelty in British gardens. What a fuss we should make about *Jasminum nudiflorum* if it were included in the same category!

Of all the score or so of *Hellebore* species and varieties in cultivation there is none to compare in beauty with the form of *H. niger* named *altifolius*. Moreover, its value is much enhanced by its early-flowering habit. The type species is never, or hardly ever, in bloom before the winter solstice; whereas *H. n. altifolius* generally begins in October and keeps up a succession of fresh flowers until the end of January. I first received this precious plant in 1872—a gift from the late Miss Frances Hope (she died in 1880), in whose garden at Wardie Lodge, on the outskirts of Edinburgh, was great wealth of hardy herbaceous growths long before these had found the favour which they now command. We have now a large quantity of this *Hellebore* notwithstanding that six or seven years ago it seemed in danger of extinction through a visitation which I take to be our old enemy *Botrytis cinerea*. This attacked and destroyed the ample foliage, and many plants died. We treated the invalids to a liberal dressing of powdered limestone; and now, whether *post hoc* or *propter hoc*, they have made good recovery, and we have enjoyed throughout midwinter a fine display of white and rose-tinted blossom. I sometimes wonder whether any attempt has been made to cross the vigorous *H. foetidus* with *H. colchicus* or *H. niger altifolius*. If only requires the pale green flowers, which *H. foetidus* carries to a height of three feet in ample panicles, to be infused with a livelier hue to render it most attractive.

It seems that quiet, stay-at-home folk, who have been in the habit of noting the earliest flowering dates of trees, shrubs and herbs have been taking part, all unconsciously, in the new science termed phenology. Accordingly I append a list showing the earliest dates of some of our winter-flowering plants in this corner of the realm. *Herbert Maxwell, Monreith.*

## MESEMBRYANTHEMUM.

(Continued from p. 70.)

### LITHOPS.

**L. bella, N.E. Br.**, in *The Gardeners' Chronicle* 1922, v. LXXI, p. 80 (Fig. 44). To this species must now be added as a synonym *L. Lericheana*, Dinter and Schwantes, which I had not seen when I described it in *The Gardeners' Chronicle*, 1926, vol. LXXIX, p. 102, but as I now have plants of *L. Lericheana* in cultivation, I find it to be identical with the previously described *L. bella*. A good figure of *L. Lericheana* was published in the *Zeitschrift f. Sukkulantenkunde*, December, 1925, p. 133, which exactly represents *L. bella*. I had not seen this figure when my description of *L. Lericheana* was published in February, 1926, or I should then have quoted it, but now, by the courtesy of Dr. F. Vaupel, the Editor of the work quoted, I am here able to reproduce that figure (Fig. 44) from a photograph of it, for which I am indebted to Mr. C. A. Maass.

**L. Mundtii, Tischer**, in *Moller's Deutsche Gartner Zeitung*, September 21, 1926, p. 330, with three figures (Fig. 45).—Growth 15-18 lines high, 14-20 lines broad, and 10-18 lines thick, obconic, quite flat on the top, with a transverse fissure about 3 lines deep all across it; surface glabrous, smooth and of a light violaceous tint on the sides, slightly rugose from impressed dendritic markings or branching lines on the top, which is of a light rust colour with the impressed markings of a dark rust colour, and with numerous blackish-grey dots sprinkled among the markings. Calyx 4-lobed. Corolla about 14-18 lines in diameter; petals 30-35, in 2 series, orange-yellow, with the tips reddish on the back. Stamens with white filaments and yellow anthers. Stigmas 6, not exceeding the stamens.

Great Namaqualand: Mundtfarm, near Witvley, in the region of Gobabis, Mundt!

This fine species is distinguished at sight from all others that I have seen by the rich rust colour of its flat top. Fig. 45 is here reproduced by the permission of Dr. F. Vaupel, the Editor of *Zeitschrift f. Sukkulantenkunde* by means of a photograph kindly sent to me by Mr. C. A. Maass.

**L. pseudotruncatella var. alta, Tischer**, in *Moller's Deutsche Gartner-Zeitung*, September 21, 1926, p. 331, with fig. A variety differing from the type by being taller than broad, with the top of the lobes more convex and the markings less distinct. Corolla yellow. Capsule 8-celled.

Great Namaqualand: Farm Hoffnung, collector not stated.

I have not seen this plant, but it is probably the plant Dinter has mentioned in one of his works as being *Mesembryanthemum truncatellum* growing at Farm Hoffnung, and for which I quoted that locality on his authority under *L. pseudotruncatella* in *The Gardeners' Chronicle*, 1922, vol. LXXI, p. 65, and the localities Jakalswater and Roessing also mentioned there upon Dinter's authority, doubtless also belong to a different species, the Roessing plant probably being *L. Ruschiorum*, N. E. Br., as I learn from Dr. A. Tischer that the true *L. pseudotruncatella* is only found in the Aus Mountains and near Windhoek.

## RIMARIA, N. E. BR.

*Rimaria microsperma*, N. E. Br. (Fig. 46).—Stemless or nearly so under natural conditions. Growths solitary or two or perhaps more to a plant. Leaves 1-2 pairs to a growth, closed together or gaping, united at the base, in adult plants 12-13 lines long, 12-14 lines broad and 10 lines thick, half-globose, flat on the face, rounded on the back, obscurely keeled at the

permum, Dinter and Derenberg, in the same volume, p. 264, with description and figure.

Great Namaqualand; growing among white quartz stones about 12 miles south of Warmbad, Dinter.

I am indebted to Dr. F. Vaupel, the Editor of the *Zeitschrift f. Sukkulentenkunde*, for permission to reproduce from the latter work by means of a photograph sent to me by Mr.

## HOME CORRESPONDENCE

**Mistletoe.**—This evergreen subject (evergreen in two ways) is referred to at some length in an article in the December issue of *The Meccano Magazine*, by W. Coles-Finch, under the title of "Holly and Mistletoe." The writer states: "It is a parasite, but unlike the few parasitic plants common to Great Britain, it is evergreen, both in summer and winter. From this we may safely conclude that it is not solely a parasitic plant, and, in fact, can be grown in pots." This assertion is certainly news to many of us. I have had the opportunity of studying Mistletoe practically all my life. I remember, many years ago, a fairly large and old bush Apple that was much infected with Mistletoe; it was worthless and ancient and was grubbed up. In its place a vigorous new bush Apple was planted. About the fifth year after planting, Mistletoe appeared, the single shoot coming out of smooth bark, with no sign that it started in the generally accepted way from a seed becoming fixed to the bark. I have seen strings of glutinous Mistletoe seeds in the Apple trees here after they have passed through the bodies of birds. They were like pearl necklaces as they glistened in the winter sunshine. In a few days a seed, if it is not again picked up by a bird, or mice, or blown away, will fix itself in no uncertain manner to the Apple bark and take on the same drab grey colour. When the sap rises and the host begins to get active, a tiny green shoot will appear; the "root" is anchored in the cambium layer, and the Mistletoe plant is starting business. To come back to the particular Apple tree I mentioned, after a few years several good bunches of Mistletoe were in full vigour upon it. The owner tried the experiment of cutting away all the small Apple wood and leaving a "Mistletoe tree." This was in July. Within a month the tree was dry and dead, the Mistletoe having quickly robbed it of life. The fact is, the Mistletoe cannot, or will not, manufacture its own

FIG. 44.—LITHOPS BELLA, N. E. BR. (SYN. L. LEBICHEANA, DINTER).

Natural size; reproduced by permission from the *Zeitschrift f. Sukkulentenkunde*.

apical part and rounded or minutely apiculate at the apex; surface glabrous, very minutely granulate under a lens, reddish-grey on dove colour, indistinctly dotted. Flower solitary, terminal. Pedicel 7-10 lines long, compressed, densely "silky-fulvous." Calyx subequally 6-lobed; lobes  $3\frac{1}{2}$  to 5 lines long,  $3\frac{1}{2}$  lines broad, obtuse, three with very narrow, membranous margins "silky-fulvous." Corolla about  $1\frac{1}{2}$  inch in diameter; petals numerous, free, in 2 series, about 8 lines long and  $\frac{1}{2}$ -line broad, cuneately linear, obtuse, incurved at the tips,

C. A. Maass, the accompanying illustration (Fig. 46) of this remarkable species, which is evidently closely allied to *R. Pole Evansii*, but differs from that species by its dotted leaves and differently coloured flowers, it also comes from a locality some hundreds of miles distant.

In the *Zeitschrift f. Sukkulentenkunde*, vol. II, p. 173, Mr. G. Schwantes has created a number of new genera belonging to this group of plants, and among them, on p. 184, is the genus *Dinteranthus*, Schwantes, under which the above plant is placed, together with *Rimaria Pole Evansii*, N. E. Br., and *Argyroderma Margaretæ*, N. E. Br. That is to say, *Dinteranthus* is a name founded upon a combination of three species which I have placed under two genera already established, and therefore is entirely inadmissible and only adds unnecessary names to the synonymy. No mention is made of characters by which *Dinteranthus* is distinguishable from *Rimaria*, and those given for *Dinteranthus* accord with those of *Rimaria*.

Of the other genera made by Mr. Schwantes I have not yet made any study, but judging from the species enumerated under them, some will undoubtedly be acknowledged as good genera, and these I note are mostly founded upon species of which (when studying all the available material in the Kew and other Herbaria three years ago in search of generic characters) I had not seen specimens or had insufficient material for examination and so left for further study as material became available. But with reference to several of the genera proposed, I feel doubtful if Mr. Schwantes has examined and dissected many of the species he enumerates under the genera he has founded, for some of the species mentioned I recognise as belonging to genera I have already characterised and others I think are doubtfully separable from *Mesembryanthemum*. Unfortunately the type species upon which he founds each genus is not mentioned, but I hope Mr. Schwantes will clearly point out which species is the type of each of his genera so that future confusion may be avoided. N. E. Brown.

(To be continued).

FIG. 45.—LITHOPS MUNDTII, TISCHER.

Natural size; reproduced by permission from the *Zeitschrift f. Sukkulentenkunde*.

yellow tinged with saffron at the apex above, fulvous on the back tinged with rosy-orange at the tips. Stamens about 4 lines long, erect in columnar mass, rich golden-yellow; filaments (probably the inner only) hairy at the base. Stigmas 7-9, divergent,  $3\frac{1}{2}$  lines long, papillate on the face, yellow. Ovary slightly convex on the top. Capsule 7-11-celled. Seeds about  $\frac{1}{2}$ -line long, dull reddish-brown.

*Dinteranthus microspermus*, Schwantes in *Zeitschrift f. Sukkulentenkunde*, vol. II, p. 184, name only, and *Mesembryanthemum micros-*

FIG. 46.—RIMARIA MICROSPERMA, N. E. BR.

Natural size; reproduced by permission from the *Zeitschrift f. Sukkulentenkunde*.

food. In winter all growth, that is, active growth, ceases, but the wood and eyes keep fresh; when active growth begins the crude sap rises, and when transformed in the young leaves of the host into elaborated sap, passes down the cambium layer as perfect food for all growth,

and here the Mistletoe feeds on it. I have seen the green, thin root passing along the branches, after carefully cutting the stem open. When Mistletoe is established in a tree its roots will form knots or eyes and push out shoots at different points. I have cut an Apple branch, with Mistletoe attached, clean away, and the following summer a new shoot has appeared from the severed root close to the cut in the Apple wood. I am carefully watching our 150 new Apple trees planted since the war, as I am anxious to discover the appearance of the parasite. There is some ground for a line of thought that there is contamination through our soil. A curious circumstance this season is that blackbirds and thrushes almost stripped our Mistletoe of berries quite early in December, though the weather had been open and the berries were unripe. To-day, January 3, I notice both the male and female Mistletoe is almost in bloom. This is about the first flower the bees work on. Concerning the article referred to, I have known of Apple trees in pots carrying Mistletoe, but a Mistletoe plant growing alone in a pot on its own roots is a novelty! *G. W. Stacey, Chorleywood Cedars.*

**James I. and Mulberry Trees.**—The following extract may interest your readers as showing how keen James I was on encouraging the planting of Mulberry trees, and may serve to improve our estimate of that not altogether prepossessing monarch. It is much to be regretted that the planting of these useful and beautiful trees should have almost ceased during the nineteenth century, so that, though aged specimens of *Morus nigra* are fairly frequent in English gardens, very few are to be found in their prime. Let us hope that the twentieth century will make amends for the laches of its predecessors. In a letter from Sir William Tate to the Deputy-Lieutenants of Northampton, dated about January, 1607, occurs this passage:—"His Majesty's pleasure is that every Knight, gentleman or men of ability should take a convenient proportion of Mulberry trees, to the price of three farthings apiece or six shillings a hundred; which trees, to the number of ten thousand, have been brought to the town of Northampton, according to His Majesty's pleasure; which we have thought fit to commend unto you, and the rather for that His Majesty will esteem it as an acceptable testimony of an extraordinary affection towards his Royal person in all such who do nourish and plant them." *Hist. MSS. Com., (Buccleugh MSS.), vol. III, p. 117. Vicary Gibbs, Aldenham House.*

**Jasminum nudiflorum.**—I never remember to have seen this Jasmine so full of flower in mid-winter as it is this year. The fine growing weather experienced last summer in combination with the unusual mildness of the present winter, accounts for the lavish display of bloom which this old hardy climber is now affording. In this district old-established specimens of it are one mass of bloom, the clear, bright yellow of which is thrown into bold relief when associated with such evergreen climbers as the Ivy. There can be no more worthy inmate of a garden than this Jasmine, and no home should be without *Jasminum nudiflorum* on its walls. *James A. Paice, Mill Hill.*

**Biennial Cropping of Apples.**—In his second note on this subject (p. 55), Mr. Grigor Roy informs us how, by drastic treatment, he induced two Apple trees to abandon their natural habit of biennial cropping. He does not prove, however, that he obtained his result by thinning the fruit, for he also thinned out the branches and spurs. I consider that the thinning of the spurs had most to do with the result. This would have the same effect as thinning the bloom, and would prevent the trees from excessive blooming in one season, and give them a chance to form fruit buds for the next year's crop. Thinning the fruit brings relief to the tree too late to do this. The regular bearing of fruit trees in orchard houses, to which Mr. Grigor Roy refers, is, I consider, due to the fact that feeding, watering and atmospheric conditions are much more under control than they are in the open. *Market Grower.*

## FRUIT REGISTER.

### APPLE HERRING'S PIPPIN.

THOSE who are planting Apples this season and wish to try a few of the newer varieties should include Herring's Pippin, which is also known as Herring's Seedling. This comparatively new dessert Apple is of excellent quality, although somewhat large for the dessert table, and fruits grown on standard trees would probably be of the best size for the table. The flesh is pale yellow, very tender and has a brisk, aromatic flavour. The variety gained the R.H.S. Award of Merit on October 5, 1920, when exhibited by Messrs. J. R. Pearson and Sons. Mr. A. H. Pearson spoke very highly of Herring's Pippin on that occasion and recommended it strongly for planting.

The side of the fruit exposed to the sun is very deeply coloured over a rich yellow ground; specimens grown further south, exhibited by Messrs. J. Cheal and Sons at the same meeting, were much more highly coloured than those to which the award was made. It is a late Apple, in season from October to November. *T.*

### PLUM DIAMOND.

REGARDING the notes on Diamond Plum in *Gard. Chron.*, p. 71, the variety is known in the midlands as Black Diamond. It is not by any means a heavy cropper. Its worst point is its susceptibility to aphid attacks. It is always the first sort in a considerable collection to show the foliage curling up with "smother-fly," and is often seriously crippled by it. These drawbacks are, no doubt, responsible for decreasing cultivation of what I consider our finest culinary Plum. *Charles E. Pearson, V.M.H.*

## VEGETABLE GARDEN.

### ONIONS.

THE Onion is one of the most important crops of the vegetable garden, and whether grown to exhibition size or merely for pickling or ordinary use should always be given the best cultivation.

If not already done, the ground the crop is to occupy should be double dug or, even better, trenched three spits deep. Leave the surface as rough as possible and dust it liberally with soot and wood-ash. In the middle of March the plot should be dug over with the fork and the soil broken as finely as possible. To obtain very large Onions sow the seeds thinly in boxes of light, friable compost, consisting of two parts loam, one part leaf-soil and one part old hot-bed or Mushroom-bed manure, with a good dash of sand to render it porous. Pass the materials through a half-inch sieve. Well crock the boxes or pans and place some rough material over the drainage to facilitate good drainage. Three parts fill the receptacles, which ever kind is used, with the soil, and make it firm, then sift a little soil on the surface through a finer sieve. Sow the seeds thinly and evenly, cover them with a fine layer of soil, press them down and water them with a fine-rosed can. Germinate the seeds in a temperature of 60°, and cover them with glass and paper to conserve the moisture. Germination will soon take place, and so soon as the seedlings appear remove the covering and expose them to all the light available. The best place in which to grow the seedlings for a time is a shelf in a house with a temperature of about 55°, and so soon as they are large enough to handle, prick them off into boxes containing similar compost as before. Place the plants about two inches apart and give them tepid water of the same temperature as the house. Grow them in an early vinery or Peach house that has been started, where they can have gentle warmth and also fresh air to keep them sturdy. Water the soil very carefully, spray the plants overhead on bright days, and stir the surface soil occasionally with a pointed stick.

When the plants have made good growth and space is required for other things, the boxes should be transferred to a heated pit where the plants may be given more air when the weather is favourable. Eventually they may be placed

in a cold frame, where they may remain until planting out time arrives. The lights should be removed on warm, bright days, and a little air admitted all through the night to harden the plants. At this stage the young Onions will require more water, which should be applied in the mornings.

Planting time may vary according to the locality, but the middle of April is a suitable date.

When the ground is given its final forking about the end of March, give it another dusting of soot, working this well into the soil. Before planting tread the soil when it is dry to make it firm, and then neatly rake it over with a small iron rake. In planting, use boards nine inches wide to walk on, and rake the bed level as the work proceeds. Place a line down one side of the bed, lift the young plants very carefully from the boxes and set them in deep holes that will accommodate the long roots. On no account cramp the roots in too small a space; make a deep hole so that the long roots can go down well. The base of the plant should be about a quarter-of-an-inch below the surface, or just deep enough to enable the seedling to stand upright. A space of twelve inches from plant to plant in the rows will be sufficient, and fifteen inches between the rows, as this will allow plenty of room for using the Dutch hoe.

Water each row as it is completed, and when the bed is planted remove any loose soil around the edges to give it a neat and tidy appearance.

Where a large bed is planted, it is well to leave a pathway two feet wide between every eight or nine rows to make easy access for syringing, watering, weeding, etc. For a week or so, the young plants should be sprayed overhead twice daily, but after that spraying once in the afternoon will suffice. So soon as the plants are well established, mulch the bed with sifted manure from an old Mushroom-bed. Where it can be obtained, drainings from the farmyard, diluted with water, are very beneficial to the crop, and an occasional dusting of some approved artificial manure around each bulb will help to produce fine specimens.

If mildew appears dust the plants around their bases with lime and if this does not check it, pull out affected plants and burn them otherwise the disease will spread.

Keep the bed free from weeds and stir the surface occasionally with the Dutch hoe taking care not to damage the base of the bulbs. As the plants increase in size, loose skins should be removed, and if any of the tops fall over before they are ripe they should be supported with a small stake. When it can be seen that the bulbs have done growing, the tops may be bent down; this may be done two rows at a time placing the tops in between the rows. As the bulbs become well-ripened and are ready for harvesting lift each one with a fork, allowing the roots to remain and turning the base of the bulb towards the sun to thoroughly ripen that part. Turn the bulbs and eventually cut off the tops; tie the neck of each Onion with matting. Each bulb should be handled carefully to prevent bruising it.

An excellent place in which to ripen Onions completely is a cool vinery or Peach-house; after a week or so in these houses they may be removed to the storeroom and will keep sound until the following spring.

Onions for ordinary use may be raised by sowing the seeds on a half-spent hot-bed, such as has been used for forcing early Lettuces or Asparagus. Sow the seeds thinly in drills and water them well. Close the frame until the seedlings appear, then admit plenty of air. So soon as the young plants are strong enough, lift them carefully and plant them in ground that has been well prepared previously, placing them about four or five inches apart. Water them and afterwards keep the bed clean by hoeing; an occasional dusting with old soot during showery weather will benefit the plants. A large crop is obtained by this method, which is much better and more economical in regard to seeds than sowing out-of-doors, whilst it does away with thinning; the bulbs are also far less liable to be attacked by the Onion fly or mildew. All Onions should be grown in the sunniest and most open position of the garden. *R. W. Thatcher, Carlton Park Gardens, Market Harborough.*

## CELERIAC.

CELERIAC, or, as it is sometimes called, Turnip-rooted Celery, is probably not grown in this country to the extent it deserves to be. On the continent (especially in France and Germany) it has been extensively cultivated for many years. The edible part is the swollen root which forms a "bulb" very similar to the Turnip in appearance, the leaf-stalks being rejected.

When well-grown and properly cooked, Celeriac is a delicious winter vegetable, and those who like boiled Celery will find this dish to their liking. It may also be used in place of Celery for flavouring purposes.

To be successful with this vegetable the ground should have been cultivated deeply and manured generously. Seeds should be sown in gentle heat, about the first fortnight in March, and when the seedlings are large enough, pricked out into fairly rich soil in boxes or frames in exactly the same manner as Celery. After the plants are well-hardened, they should be planted out early in June. At this point the procedure differs somewhat to that of Celery. Instead of planting being done in trenches, Celeriac should be planted in shallow drills about four inches deep, according to the nature of the soil, but on heavy land planting on the flat is recommended.

The rows should be from eighteen to twenty-four inches apart, allowing about fifteen to eighteen inches from plant to plant, according to the variety and the method of cropping adopted; sometimes an intercrop is grown that can be cleared before the main crop requires the space. Any lateral growths should be removed before planting, and great care taken not to plant deeply.

Water should be given copiously whenever needed; the drills (when adopted) simplifying this operation. Little further attention will be necessary beyond occasional hoeing and the removal of any suckers which may appear on the sides of the plant from time to time.

A sharp watch must be maintained for the appearance of the Celery fly. Frequent dustings with soot will do much to keep this pest in check, besides having a beneficial effect upon the plants.

There are two methods of keeping this crop during the winter; one is to lift the plants in November so soon as growth is completed, trimming the large, outside leaves, retaining only a few at the crown, and storing the roots in sand in a cool shed; and the other being to leave the plants in the ground and draw a little soil over the "bulbs" covering them with protecting material during very frosty periods.

There is not a large range of varieties to choose from, but in these considerable difference exists, as may be seen from the accompanying illustration (Fig. 47), the plant on the right being both large in leaf and coarse-rooted, whereas the other has a neat, clean root and not an undue proportion of leaves. In a trial of this vegetable conducted at Wisley last year, the following varieties proved outstanding:—Giant Ball and Snowball—these were continental stock; and Close Planting (the variety on the left of the photograph) which came from a British source. *J. Wilson, Wisley.*

## PUBLIC PARKS AND GARDENS.

At a special meeting of the Parks Committee of the Glasgow Corporation, held on Tuesday, the 4th inst., a letter was read from Mr. Edward Matthews, intimating his resignation as Director of City Parks. It was agreed to accept the resignation, and a sub-committee was appointed to consider the vacancy. Mr. Matthews was appointed Assistant Director on the death of Mr. James O'Rourke, six-and-a-half years ago, and it was only in 1923 that he was appointed Director on the retirement of the late Mr. James Whitton.

LAMPETER Town Council proposes to apply to the Ministry of Health for sanction to borrow £500 for acquiring and developing the Bryn field as a park and recreation ground.

## SOCIETIES.

## ROYAL CALEDONIAN HORTICULTURAL.

THE annual general meeting of this Society was held in Dowell's Rooms, Edinburgh, on the 12th inst., a week later than usual. Mr. W. J. Thomson presided over a good attendance of the members.

The financial statement for the past year showed a credit balance of £60 18s. 4d. The following office-bearers were elected: Hon. President, the Earl of Stair; President, Mr. W. J. Thomson, and Vice-President, Mr.

The policy of the Board of Agriculture for Scotland was subjected to severe criticism in a discussion which followed. A motion was put by Mr. Richardson to the effect that the Council resume negotiations with the Board of Agriculture with reference to putting into operation the scheme submitted to the Board in 1923 for the suppression of plant pests, and also with reference to the publication of the statistics of the fruit survey organised by the Society which was also then submitted to the Board.

In support of his motion Mr. Richardson said the country was overrun with big bud, reversion and mildew on Black Currants, and if reversion goes on as at present Black Currants would soon be a thing of the past. Millions of

FIG. 47.—CELERIAC CLOSE PLANTING (LEFT), GIANT PRAGUE (RIGHT).

David King. Eight nominations were made for three vacancies on the Council, and on a vote the following were successful: Messrs. John Scott, Westerlea; George F. Anderson, Whittingehame and Alexander Innes, Dean Cemetery.

In the annual report the Council stated that having regard to the financial position and the fact that the five shilling membership involved a loss to the Society, it was proposed to increase the annual subscription to seven shillings and sixpence. It was also announced that a legacy of £400 had been bequeathed by the late Mr. Fraser on the understanding that the interest on that sum was to be allocated in prizes for alpinists at the spring show.

After some criticism by Mr. A. D. Richardson, the report was adopted.

A motion to the effect that the meetings in future be held in the afternoon instead of the evening was defeated by a large majority.

pounds were being lost every year by diseases and insect pests and nothing was being done to stop it.

Mr. Stewart, in seconding, remarked that the lady mycologist who had been appointed by the Board was not getting a fair chance, and he thought the Society should press the Board to get an entomologist appointed. He understood that a fruit survey was now being taken up at the different colleges.

Mr. Robert Fife, as a member of the deputation which approached the Board, said he was wholly at one with the object of the motion. The Board of Agriculture had treated the Society shabbily. They left the book unpublished and were now doing the work all over again, but he was satisfied that it would not be well done, for they got things better done by private enterprise than under officialdom. The Board had spent thousands of pounds on the plant-breeding station and they had not

even a Potato to show for it. He ventured to suggest that if a premium had been offered, say, for an improved type of Midlothian Early, a whole host of breeders in the country would have produced what was desired by this time.

Mr. Scarlett paid testimony to the good work done by Mrs. Alcock, and he not only supported the motion to its fullest extent, but claimed for the Society a certain amount of supervision of the survey work.

After further discussion the motion was adopted unanimously.

It was agreed to send congratulations to Mr. Harrow, who had been distinguished by the award of the Victoria Medal of Honour in Horticulture and to Sir James Watt, Carlisle, who had been head of Messrs. Little and Ballantyne for fifty years, on his knighthood.

### NATIONAL ROSE. ANNUAL MEETING.

THE annual meeting of the National Rose Society was held at Caxton Hall, Westminster, on January 18. The President, Mr. C. C. Williamson, presided, and the attendance numbered about 120. After the minutes of the last annual meeting had been read and signed, the President submitted the Annual Report of the Council for 1926. The following are the chief items in the Report:

The Society has during the past year continued to make steady progress, the number of new members being 2,048. The total membership is now over 14,105.

During the course of the year, several important additions have been made to the Library, and many members have availed themselves of the privileges of having Rose books sent on loan by post.

The Council will welcome gifts of useful and suitable books from members of the Society. It is desired to extend the Library so that it may contain all standard books on botany, hybridisation and the history and development of the Rose.

The Society's slides continue to be in great demand, so much so that it has become necessary to provide an additional set which will, it is hoped, be ready in the autumn.

Six shows were held during the past year. The Spring Show was again held in the Horticultural Hall, on Friday, April 23, and was honoured with a visit by H.R.H. Princess Mary. The exhibits were of a very high order, and a source of much pleasure to a large number of visitors. Some inconvenience was caused by overcrowding, but the Council is pleased to report that arrangements have now been made which will obviate any cause of complaint in future.

The Great Summer Show was held in the Royal Botanic Gardens, Regent's Park, on Friday and Saturday, July 2 and 3, and was visited by Her Most Gracious Majesty the Queen. The show will remain a memorable one for the remarkable number of exhibits staged by nurserymen.

The show of new Roses was held in the Horticultural Hall on Friday, July 23, but owing to the weather conditions which had prevailed for some days prior to the show, the exhibits were below the usual standard.

The Provincial Show at Leeds was held on Tuesday and Wednesday, July 13 and 14. The sub-tropical weather conditions which prevailed prior to, and on the day of the show, rather spoilt what might have been a fine show.

The Provincial show, which was held at Southport on August 25, 26 and 27 was, perhaps, the most successful provincial show the Society has ever held. The ideal weather conditions which prevailed before and during the show enabled exhibitors to stage the Roses at their best. The Southport Floral Committee spared no trouble or expense in their efforts and earned the gratitude of the exhibitors and the appreciation of the large number of visitors.

The Autumn Show was held in the Horticultural Hall on Friday and Saturday, September 10 and 11. Last year the experiment was tried of holding this show in tents at the Botanic Gardens, but owing to the uncertainty of the weather it was felt that too great a risk was being taken, and it was decided to return to the old conditions and hold the show under cover. As usual, this display of autumn Roses was a very great success and attracted a very large number of visitors.

The financial position of the Society is a source of much gratification. The total receipts for the year, including the balance of £70 16s. 7d. brought forward from last year, amounted to £8,853 12s. 9d., and the total payments for the same period, including the sum of £1,109 9s. 1d., which has been placed to the credit of the Reserve Fund, amount to £8,811 1s. 3d.

The Council has, with great regret, to record the loss during the year of three very old and tried friends of the Society. Mr. Samuel McGredy, who was one of the Society's oldest members, and widely known for the numerous new varieties of Roses raised by him. The Rev. J. H. Pemberton, who was the oldest member of the Society, and a Past President, and well-known to all exhibitors. Mr. E. B. Lindsell, another Past-President, and one who for many years was the Champion Amateur Rose Grower.

In conclusion, the Council desires to record its acknowledgment of the special and valuable services which have been rendered to the Society during the past year by Miss Willmott, F.L.S., one of the Society's Vice-Patronesses.

The President made a few comments on the Report, and referred to the great loss the Society had sustained in the deaths of Mr. McGredy, the Rev. Joseph Pemberton, Mr. E. B. Lindsell and the Rev. Page-Roberts.

Mr. Cowley raised the question of a trial garden and was informed that the matter was under the consideration of the Council. Mr. H. Oppenheimer seconded the adoption of the Report, and it was carried without further comment.

The Hon. Treasurer, Mr. S. A. R. Preston-Hillary, next submitted the financial statement, which was passed without discussion. The balance sheet showed that subscriptions amounted to £7,185 7s. 0d., the proceeds of shows, £702 4s. 6d., advertisements £308 13s. 4d., and interest on invested funds, £349 4s. 2d., the total income amounting to £8,853 12s. 9d. Payments included £3,046 17s. 5d. for publications; postage and sundry expenses, £79 15s. 6d.; honorarium to the Hon. Secretary, £350; salaries, £566 10s. 2d.; expenses of shows, £924 2s. 2d., and prizes, including medals and plate, £1,104 8s. 0d. The sum of £1,109 9s. 1d. had been invested during the year, leaving a balance in hand of £42 11s. 6d.

The meeting next proceeded to consider the result of the ballot sheet for the members of the Council, there being thirty-nine nominations for thirty-six seats. All the old members were re-elected, with the exception of Messrs. C. S. Gordon-Clark, Stuart-Hogg and Dr. Sauer, and their places were filled by the election of Messrs. W. A. Harvey, Eric Holroyd, J. W. Jones and Dr. R. C. Turnbull, the nomination of Mr. John N. Hart as a Vice-president causing a further vacancy. Mr. C. C. Williamson having completed his two years of office, Mr. H. R. Darlington was appointed President and Mr. Darlington's place as Deputy-President was taken by Mr. Arthur Johnson.

At this stage of the proceedings, after a vote of thanks to the retiring President, Mr. Darlington presented Mr. Williamson with the Dean Hole Memorial Medal.

A vote of thanks to the officers and Council, proposed by Mr. W. Harvey and seconded by Mr. J. W. Jones, was accorded with enthusiasm, and the meeting concluded with a hearty vote of thanks to the Chairman.

Following the business proceedings, members were provided with tea and entertained to an excellent programme of music.

### ROYAL HORTICULTURAL.

JANUARY 25.—A very bright and attractive exhibition was provided on this occasion. Forced bulbous flowers contributed colour, and fragrance, Orchids arrested attention, while Cyclamens, Acacias, early hardy flowers and shrubs added to the interest of the meeting. An exhibition of unusual interest was the superb collection of Citrus fruits exhibited by CECIL HANBURY Esq. (Supt. Mr. S. W. McLeod Braggins), La Mortola, Ventimiglia, to which a Gold Medal was awarded. Several interesting novelties were submitted.

### Orchid Committee.

Present: Sir Jeremiah Colman, Bt. (in the chair), Mr. Gurney Wilson (Hon. Sec.), Hon. H. D. MacLaren, Mr. Fred J. Hanbury, Mr. C. J. Lucas, Mr. H. H. Smith, Mr. A. Dye, Mr. Chas. H. Curtis, Mr. A. McBean, Mr. J. E. Shill, Mr. Fred K. Sander, Mr. H. T. Pitt, Mr. T. Armstrong and Mr. John C. Cowan.

### FIRST CLASS CERTIFICATES.

*Cattleya John Henry, Dell Park var. (C. Astron × C. Lady Rowena).*—The original C. John Henry was exhibited on October 5, 1926, when it gained an Award of Merit. The new variety is an advance on the type and has exquisitely beautiful flowers of large size and fine form, white with lemon-yellow in the throat. Shown by Baron BRUNO SCHRODER (gr. Mr. J. E. Shill), Dell Park, Egham.

*Odontonia Nubia var. Renown (Miltonia Charlesworthii × Odontoglossum Doreen).*—A handsome Orchid bearing three fine flowers, with deep, velvety crimson sepals and petals, and a large lip heavily marked with carmine on a whitish ground, a small red mark and golden disk. Shown by Messrs. CHARLESWORTH AND Co.

### AWARD OF MERIT.

*Cymbidium Atalanta, Brockhurst var. (erythrostylis × Alexanderi).*—A graceful hybrid, the plant exhibited carrying thirteen flowers. The colour is pale apple-green with a pleasing salmon-pink suffusion; the lip is marked and tipped with deep brown. Shown by FRED J. HANBURY, Esq. (gr. Mr. Farnes), Brockhurst, East Grinstead.

### GROUPS.

A most interesting exhibit from H. T. Pitt, Esq. (gr. Mr. Thurgood), attracted a great deal of attention. *Epidendrum Endresio-Wallisi* was conspicuously good, and represented by numerous flowering plants. The old *Ada aurantiaca* was also shown, together with *Cymbidium Alexanderi*, *C. Traceyanum*, the handsome *Lycaste Balliae superba*, *Cypripedium Grace*, Pitt's var., and many fine forms of popular, large-flowered *Cypripediums* and coloured *Odontoglossums*.

Sir JEREMIAH COLMAN (gr. Mr. J. Collier), showed *Masdevallia polystriata* and *M. tovaensis*, both finely flowered, *Cynorchis compacta*, the brilliant *Sophrone-Laelio-Cattleya Saxa*, *Gatton Park var.*, the small, white-flowered *Dendrobium Chalmersii*, the yellowish *Sophroneitis grandiflora var. Lowii*, some *Cymbidium*s and the now rarely seen *Masdevallia deorsum*.

The handsome group of Orchids put up by Messrs. COWAN AND Co. commanded attention by reason of the numerous examples of *Oncidium splendendum* and *O. Cavendishianum* it contained, the golden flowers of the large spikes being unusually attractive. In addition, the display included *Cattleya Woltersiana*, *Cypripedium Curtisii exquisitum*—one of the deepest-coloured forms we have seen of this species—*Cymbidium*s, and a fine array of the up-to-date varieties of bold-flowered *Cypripediums*.

Ten glorious plants formed the exhibit of Messrs. STUART LOW AND Co.; these were *Brasso-Cattleya Penelope*, with four flowers; *B.-C. Nestor*, three big blooms; *B.-C. Mirabilis*, with a pair of yellow flowers; *Cattleya Enid alba* and *C. Maggie Raphael alba*, with three and four flowers respectively, *Laelio-Cattleya Locarno*, *Odontodia Hammerae*, *O. Wilsonii*, *Dendrobium Pallens* and the golden *D. chesingtonense*.

Messrs. CHARLESWORTH AND Co.'s contribution contained lovely spikes of *Odontoglossum armainvillierense var. xanthotes*, a white *O. crispum* and *O. eximium xanthotes*. An outstanding plant was *Odontonia Nubia var. Renown*, with superb crimson-brown colouring. Other good things were *Miltonia Wm. Pitt*, a grand form of *Odontoglossum Titius*, *Dendrobium nobile nobiliss*, and the quaint little *Bulbophyllum Dayanum*.

Messrs. SANDERS showed the beautiful *Brasso-Cattleya Albion*, the showy *Cymbidium Ernest Sander* and the handsome *Odontoglossum Vulximum*, with highly-coloured, large blooms. Messrs. SUTTON BROS. were modest exhibitors and showed *Cypripediums* in variety, *Oncidium splendendum* and *Laelio-Cattleya Marathon*. Mr. A. J. KEELING sent a few large-flowered *Cypripediums* and *Cymbidium*s.

### Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. R. Findlay, Mrs. Helen Lindsay Smith, Lady Beatrix Stanley, Mr. Wm. Howe, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. W. A. Bilney, Mr. Hugh Dickson, Mr. E. R. Jones, Mr. Geo. Churcher, Mr. A. E. Vasey, Mr. Jas. B. Riding, Mr. J. T. West, Mr. D. B. Crane, Mr. W. P. Thomson, Mr. G. W. Leak and Mr. Charles E. Pearson.

Section B.—Mr. Gerald V. E. Loder (in the chair), Mr. W. J. Bean, Mr. G. Reuthe, Mr. George Harrow, Mr. Reginald Cory, Mr. A. Bedford, Mr. L. R. Russell, Mr. E. H. Wilding, Mr. T. Hay, Hon. Henry McLaren, Mr. Charles T. Musgrave, Mr. C. J. Lucas and Mr. R. C. Notcutt.

### AWARDS OF MERIT.

*Acacia Baileyana.*—This is probably the best known of the Mimosas and is generally considered to be the hardest of all the species. It was described by Baron Von Mueller in the *Transactions of the Royal Society of Victoria*

so long ago as 1887, and a good illustration appeared in *The Gardeners' Chronicle* of January 13, 1894. Large quantities of cut sprays are sent to Covent Garden and other markets from the Riviera in the early spring when the sprays of delicate grey leaves and spikes of yellow flowers brighten florists' shops and street vendors' stalls. Shown by Commendatore CECIL HANBURY, M.P. (gr. Mr. S. W. M. Braggins), La Mortola, Ventimiglia, Italy.

*Acacia Hanburyana*.—A seedling *Acacia* was discovered by Mr. Joseph Benbow when he was in charge of the La Mortola Gardens, growing in near proximity to bushes of *A. Baileyana* and *A. podalyriacifolia*, and there seems little doubt but that *A. Hanburyana* is the result of a natural cross between these two species. It makes a tree fully twenty feet high. The silvery phyllodes bear short leaflets similar to those of *A. Baileyana* and the round clusters of bright canary-yellow flowers are borne on pendulous spikes.

*Aloe ciliaris*.—This showy South African succulent plant is more generally known as *A. ciliata*, though this is not its correct name. The plant has linear, spreading, finely serrate, green leaves and the flowers are of a brilliant coral-red colour.

*Cotyledon (Echeveria) multicaulis*.—An attractive, dwarf, compact plant was shown. The ovate, fleshy green leaves were attractively bronzed at the tips and the solitary flowers were a deep reddish colour. All the above were shown by Commendatore CECIL HANBURY.

*Tetralochea thymifolia*.—A well-grown plant of this tender little Australian shrub was shown. As the specific name implies the neat foliage suggests that of the Thyme. In the relatively dull light of the hall the pale purple flowers were only a little more than half open, but they were sufficiently so to disclose the small, carmine blotch at the base of each petal. Shown by Sir WILLIAM LAWRENCE, Bt. (gr. Mr. Everatt), Burford, Dorking.

#### OTHER NOVELTIES.

Three large, oval, green fruits of *Araujia (Physanthus) sericifera* were shown by W. C. HADDEN, Esq., Underway, West Porlock, Somerset. In addition to the species which received award in the interesting collection of Citrus fruits, Commendatore CECIL HANBURY sent robust spikes of *Aloe arborescens* var. *natalensis*, flowering sprays of *Acacia podalyriacifolia*, and the golden-yellow *Bignonia venusta*. Mr. Braggins brought for Signor AICARDI, Villa Minerva, Poggis, San Remo, Italy, seven vases of perpetual Carnations, grown in the open. These illustrated excellent cultivation. Messrs. ROBERT VEITCH AND SON displayed vases of *Hamamelis arborea*, *H. japonica rubra*, *H. mollis* and *Mahonia japonica* var. *Bealei*.

#### GROUPS.

An excellent collection of greenhouse Cyclamen was staged by Messrs. BLACKMORE AND LANGDON. This filled an entire length of tabling and was composed of splendidly-grown plants set out in their various shades of colour. Many distinct tones were shown, such as Scarlet King, Salmon King, Crimson, Giant White and a desirable type of *Cyclamen grandiflora*. Cyclamens of merit were also shown by Mr. J. W. FORSYTH. In this collection the frilled type was especially good, though all of the "Caledonia Strain" illustrated first-rate cultivation.

Greenhouse Primulas of considerable decorative value were again shown by Messrs. J. CARTER AND CO. On the present occasion a larger display was made, and the round baskets of distinct colour varieties of *Primula sinensis* with large flowers, the stellata varieties, and *P. malacoides* made an attractive display.

An attractive exhibit of spring bulbs was made by Messrs. SUTTON AND SONS. This was composed largely of Hyacinths, of which many good varieties of the large-flowered and the multiflora types were represented. Narcissi included Paper White, Early Surprise, a pretty Barrii variety, and Golden Spur and Cervantes, Trumpet Daffodils. The many Tulips included bright flowers of *Rosa Précoce*, Brilliant Star,

and the Duc van Thol varieties. There were also showy groups of *Iris reticulata*, *Freesias* and *Lily-of-the-Valley*.

A pretty group of forced *Prunus triloba* fl. pl., *Hamamelis arborea*, *Aphelandra aurantiaca*, *Pycnostachys Dawei*, *Azalea indica* varieties, and well-fruited, little Orange bushes was made by Messrs. L. R. RUSSELL, LTD.

Carnations were shown in their accustomed quality by Messrs. ALLWOOD BROS., Mr. C. ENGELMANN and Messrs. STUART LOW AND CO. The last-named also had an attractive collection of pot plants of *Acacia Baileyana*, *Hippeastrums*, *Eranthemum pulchellum* and other useful greenhouse plants.

Cut spikes of *Hippeastrum aulicum* were included in an excellent collection of St. Brigid Anemones by Messrs. R. GILL AND SON, who also set out sprays of many uncommon Conifers, including *Pinus Montezumae*, *P. patula*, *P. Ayacahuite*, *Abies bracteata*, *A. firma* and several *Podocarpaceae*.

Interesting little rock gardens were made and planted by several exhibitors. Messrs. WM. CUTBUSH AND SON had various suitable shrubs including a shapely specimen of *Pieris floribunda*, and *Permettya mucronata*. They also planted groups of *Iris Histrio* and *I. alata*. *Crocus Sieberi*, *C. Cloth of Gold*, *Galanthus Elwesii*, *Primula Juliana*, *P. Wanda*, *Saxifraga longifolia*, and *S. Burnatii* were effectively planted by Messrs. WATERER, SONS AND CRISP.

Messrs. BARR AND SONS had an interesting exhibit of *Crocus Susianus*, various Primroses, chiefly with blue and rich yellow flowers; Christmas Roses, *Eranthis ciliaris* and other flowers, with a background of *Eleagnus pungens aurea variegata* and *Cotoneaster rugosa* Henryi. They also staged excellent pots of Roman Hyacinths. A neat little rock garden was made by Messrs. SHEPPARDS and another by Messrs. TUCKER, who displayed large breadths of *Saxifraga kostoniensis*, *S. kewensis* and *S. tridentina*. Messrs. J. CHEAL AND SONS exhibited *Primula Wanda*, *Eranthis ciliaris*, *Crocus Sieberi* and other alpine.

A lovely collection of Conifers, such as are valued for the rock garden, was arranged by Mr. G. G. WHITELEGG. In addition to the sorts shown on previous occasions, he had excellent specimens of *Podocarpus*, of several species, *Picea nigra Doumettii*, and *P. pungens Kosteri procumbens*. Mr. J. KLINKERT showed topiary specimens.

There were various exhibits of garden sundries, the chief of which were various useful baskets, coconut-fibre mats, and joinery, made by the blinded soldiers at St. Dunstons; a greenhouse and garden frames shown by Messrs. BOUTON AND PAUL; garden tools, by Messrs. THOS. GUNN AND SONS; knives from Messrs. JOSEPH ROGERS AND SONS and Mr. J. PINCHES' excellent metal labels.

Many artists contributed paintings of flowers and garden scenes, and Mr. JAMES MACDONALD brought over one hundred herbarium specimens of dried grasses of great interest.

#### FRUIT AND VEGETABLE COMMITTEE.

Present: Mr. C. G. A. Nix (Chairman), Mr. W. J. Lobjoit, Mr. J. Cheal, Mr. P. C. M. Veitch, Mr. G. F. Tinley, Mr. T. Pateman, Mr. E. Beckett, Mr. W. F. Giles, Mr. A. Poupert, Mr. J. C. Allgrove, Mr. E. A. Laxton, Mr. H. V. Taylor, Mr. W. H. Divers, Mr. H. Prince, Mr. E. Neal and Mr. A. N. Rawes.

Two new Apples were submitted to the Committee and both were recommended for trial at Wisley. The one, named *Opalescent*, was brought by Mr. P. C. M. VEITCH, of Exeter; it is an American variety with a very sweet, juicy flesh, and quite good for a December Apple, but nothing exceptional in flavour. It is of the oblong type, as classified by Bunyard in his *Handbook of Fruits*, with a pale yellow skin, covered with pale red on the side next to the sun. The stalk is set in a deep, narrow cavity and is about half-an-inch long. The other variety is of the conical type, with a broad base, somewhat after the Worcester Pearmain type. This variety, which is named *Connoisseur*, was shown by Mr. W. TAYLER. This Apple is also very juicy and sweet, and, perhaps, a little better-flavoured than *Opalescent*. The

skin is yellowish, covered almost entirely with pale crimson, which appears in darker patches at intervals.

Col. A. BATES, of Basingstoke, Hampshire (gr. Mr. W. R. Beesley), showed a dish of Oranges, taken from a tree in a greenhouse in which a temperature of about 50° is maintained, bearing altogether some five hundred fruits. There was nothing remarkable in the quality.

An exceptionally fine display of Citrus fruits was shown by CECIL HANBURY, Esq., from his gardens at La Mortola, Ventimiglia, Italy (Supt. Mr. Braggins). The collection included fifty-one distinct varieties. The exhibit was arranged very attractively on a black velvet ground and relieved with vases of *Acacia*, *Euphorbia* (*Poinsettia*) and *Cotoneaster* sprays covered with berries. The fruits, many of which were attached to branches with foliage, were in splendid condition. They were brought direct from La Mortola on Sunday last by Mr. Braggins who has met with disappointment on two previous occasions in sending them over by ordinary rail and boat, owing to delays. The Committee recommended a Gold Medal for the collection and a Cultural Commendation to Mr. Braggins. All kinds of Citrus fruits were represented from the big specimens of *Citrus Medica* as large as Mangolds to the smaller Lemons and Mandarin Oranges. Grape Fruit was shown in clusters of five to eight resembling bunches of huge Grapes, hence, doubtless, the name Grape Fruit. Some of the flowers of the Oranges shown are used locally for the making of perfume and the Bitter Orange for the making of marmalade; in some cases the fruits themselves are used for perfume-making by scratching the peel when perfume similar to that of Eau de Cologne is obtained. One of the best flavoured of the Oranges was *Citrus nobilis* (Mandarin) these fresh fruits being far superior to those which are picked green and sent to market for sale in our shops. *Citrus Aurantium* var. *sinensis* is also a very finely flavoured Orange.

#### BRITISH FLORISTS' FEDERATION.

THE annual general meeting of members of the British Florists' Association was held at the Connaught Rooms, Great Queen Street, W.C., on Friday, January 21. Mr. D. Ingamells, the President, occupied the chair, and was supported by Mr. W. E. Wallace, Mr. Alfred W. White, past presidents, and numerous members of committee. The attendance was moderate, many members being absent through illness (influenza).

The Report of the Committee and the Statement of Accounts for 1926 were submitted. The former contained references to the fine exhibit of market plants and flowers arranged by the Federation at the Royal Horticultural Society's Hall in November and to which a Gold Medal was awarded. The plants and flowers were contributed by Messrs. P. Ladds, M. Hutchings, Lowe and Shawyer, Jas. Sweet and Son, and Geo. Monro, Ltd., and skilfully and artistically displayed by Mr. H. Jolis, to all of whom the Committee offered thanks for their generous help. It appeared that the Federation frustrated the endeavours of the Transistaires to impose higher charges upon flowers imported from France, and to establish a carriage forward system, a system which would have meant the flooding of the market with flowers of low quality. Now that the Chamber of Horticulture has ceased to function, the Committee decided that the Federation should continue as a separate body and not join the Horticultural Trades' Association under the proposed scheme of co-ordination. The principal business before the Committee towards the end of the year was the opposition to the Bill before Parliament for the removal of Covent Garden Market. Other special references in the Report were to the International Commercial Horticultural Conference in Paris: to a lecture on the use of Poison Gas for the Control of Insect Pests, given to the members, by Mr. Theodore Parker; and to the losses sustained by the deaths of Mr. Fred W. Cory and Mr. Thos. Windle.

The accounts showed a turnover of £269 3s. 10d.

leaving a balance in hand of £86 14s. 4d. The Federation's exhibit at Westminster involved an expenditure of £26 13s. 6d., and was sold for £43 18s. 6d. Income from subscriptions amounted to £220 15s. 0d., and it was of interest to notice that some members had paid forgotten subscriptions for so far back as 1923.

The President briefly reviewed the work of the year in moving the adoption of the Report and Accounts, and the motion was carried. Following a vote of thanks to the Committee and officers for services rendered, Mr. Ingamells proposed the election of Mr. H. T. Mason, of Hampton Hill, as President for 1927. This motion was carried unanimously and with applause, and Mr. Mason at once filled the Presidential chair and made it his first duty to thank the retiring President for his services and congratulate him on his successful year of office.

The retiring members of Committee were re-elected. Mr. Ingamells was appointed to fill the vacancy arising by the elevation of Mr. Mason, while Mr. D. Sweet was elected to the place rendered vacant by the death of Mr. T. Windle.

Several new members having been elected, the meeting adopted a resolution giving the Committee full powers to oppose the Bill for the removal of Covent Garden Market, and promising loyal financial support. It was stated that standholders in the market would be assessed in view of the commitments necessary to put forward a strong opposition.

This concluded the general business. Tea was served, and in the unavoidable absence of Mr. F. W. Ladds, the President opened an discussion on "Gluts of Flowers and How to Prevent Them." A very brisk discussion ensued from which the chief points urged as preventive measures were: closer co-operation between growers and salesmen so that the latter might be duly notified of impending gluts; cutting all flowers just before they were ready, thus giving better value to the ultimate purchaser, instead of holding them over in the hope of a rise in price; the training of better educated young folks as retail florists; and more enterprise on the part of retailers in the offer of "special lines," when supplies of certain flowers were in excess of the demand. It was pointed out that in the absence of weather control gluts could not be entirely prevented, but growers did much to create gluts by trebling their cultivation of any kind or variety that happened to obtain good prices in the previous season.

The President thanked those who had assisted in the discussion, and was, in turn, thanked for presiding.

Later in the evening many members and friends, including ladies, dined together at the Connaught Rooms under the presidency of Mr. H. T. Mason. A very enjoyable evening was spent, a capital musical programme provided and the tables were charmingly decorated by Mr. Harry Miles with Carnations, Daffodils, Tulips and Roses sent by Mr. C. Engelmann, Mr. H. T. Mason, Mr. W. E. Wallace and Mr. Alfred W. White.

### BANFFSHIRE HORTICULTURAL.

A HIGHLY satisfactory condition of affairs within this Society was reported by the Secretary Mr. John Mann, at the annual meeting. The income for the year was £451 5s. 11d., being £55 0s. 11d. less than the previous year. This was accounted for by the decrease on the admission charges. On the expenditure side the Committee had increased the prize-money, which now stood at £279 10s. 0d. The actual cash balance on the annual show was £57 7s. 11d., but to that had to be added capital expenditure amounting to £35 5s. 9d., so that in all the credit balance was £92 17s. 4d. The total assets of the Society now amount to £770 4s. 4d., with a balance in hand of £461 7s. 4d.

Provost Gordon, who presided, moved the adoption of the report in a eulogistic speech, Baillie Davidson seconded, and it was carried unanimously. The Provost was again appointed President and Mr. Mann was re-elected Secretary. It was agreed that the annual show be held on Wednesday, August 17.

## Obituary.

**Charles A. Bayford.**—It is with profound regret we learn, through Mr. W. Crump, of the death of Mr. C. A. Bayford, for the past twenty years gardener to C. W. Dyson Perrins, Esq., Davenham, Malvern. Davenham is one of the best-kept gardens in the midlands and has been much enlarged and improved under Mr. Bayford's care. Mr. Bayford was only fifty-nine years of age. He was highly esteemed in the Malvern district and was an enthusiastic member of the Worcester Auxiliary of the Gardeners' Royal Benevolent Institution. A portrait and appreciation of Mr. C. A. Bayford appeared in *The Gardeners' Chronicle* of February 27, 1926.

**Walter Ramsay Elliot.**—We deeply regret to record the death of Mr. Walter Ramsay Elliot, which took place at Cambridge on the 9th inst. Born at Edinburgh, sixty-two years ago, he came of a gardening family, his father being gardener to the late Lord Armstrong, at Jesmond Dene, Newcastle-on-Tyne. He was apprenticed with Messrs. William Fell and Co., of Hexham, and after serving in the various departments in connection with this firm, he went to Hereford, to take charge of the nurseries of the late Mr. John Cranston, which ultimately became the King's Acre Nurseries, Limited. From there he went to Messrs. Dicksons, Limited, Chester, and eventually took charge of the nursery which this firm then had at Dolgelly. During his service with this firm, it was he who actually found the original plant of *Cupressus macrocarpa lutea*. From there he went to the old firm of Messrs. William Paul and Sons, Waltham Cross, and after a few years of experience there was appointed manager of the Feltham branch of Messrs. James Veitch and Sons, Ltd. Leaving there in 1902, he became general outdoor manager to Messrs. Wood and Ingram, Huntingdon, and remained with the present proprietor, Mr. Henry Perkins, until his death. With his varied experience, he was a fine all-round nurseryman, a first-class grower, and had a wonderful knowledge of trees and shrubs of all kinds and their propagation. He also took keen interest in seed-growing, and during the last quarter of a century, in cattle, horses, and in the general agricultural side of the firm's activities. He had been in failing health for some months, and in the end succumbed rather suddenly to heart failure. He had two sons, both of whom were killed in the War, and one daughter who was found drowned about a year ago. His wife survives him.

**Emil Goericke.**—We regret to learn of the death on December 15 last, of Emil Goericke, a nurseryman of Niemberg, near Halle, Germany. He was born in 1864, and after serving his apprenticeship in Cöthen, he had positions in turn in establishments in Erfurt, Frankfurt, Strassburg, Nancy, Rheims, Ghent and Brussels. He was for a year in a responsible position in the celebrated firm of Lambert, at Trier. In 1895 he founded his own nursery at Niemberg, and previous to the War he specialised in Asters, his Hohenzollern Aster being well-known; he was also an expert in heating, and in 1925 perfected a new type of hot-water boiler.

**Alexander Macdonald.**—We regret to announce the death of Mr. Alexander Macdonald, late schoolmaster, Durris, near Aberdeen. Born at Forgue seventy-one years ago, he had, outside the sphere of professional scientists, few equals. On his retirement from scholastic duties in 1921, he became prominently associated with the Deeside Field Club, Aberdeen Natural History Society and other kindred organisations. He was joint editor of the *Deeside Field*, to which he contributed many valuable and learned articles; was assistant editor during the closing years of his retirement of the *Aberdeen University Review*, and in his lifetime published many pamphlets on the subjects he loved so well. It has been declared that but for his duties as a teacher he would in respect of the humblest forms of life have been a Scottish Faber. The funeral took place on Tuesday, the 18th inst., in the churchyard of his beloved Durris, in the

valley of the Royal Dee, and was largely attended. Mr. Macdonald is survived by a widow and family of three sons and two daughters.

**James Taylor.**—On Sunday, January 16, Mr. James Taylor passed away, after a painful illness, at the age of seventy-three. Deceased was well-known in gardening circles, more especially in connection with Orchids, as he represented Messrs. Sanders of St. Albans for some twenty years, chiefly in the midland counties. Prior to joining Messrs. Sanders, he was head gardener to the Duchess of Montrose, at Sefton Lodge, Newmarket. Eventually he represented Messrs. Mansell and Hatcher, of Rawdon, Yorks, for several years. The illness and death of his wife and his own poor state of health had rendered him unable to work for some time past.

## TRADE NOTE.

By a coincidence, the figures of patent applications in H.M. Patent Office for the year 1926 are almost identical with those of the previous year, and this may be considered very satisfactory in view of the many difficulties consequent upon the general strike, the miners' strike, and the unemployment caused thereby. Messrs. Rayner and Co., the well-known London patent agents, inform us that in 1926 inventions relating to gardening and horticulture in general have been well maintained, as will have been observed by the regular contributions published in connection with patents, etc. A noticeable feature in the year's record is the large number of U.S. Americans and Germans who are obtaining patents for their inventions in this country. Mr. Rayner is certain that if no trade disturbances had occurred the figures for the year would have been much higher, and looks forward to important developments in the present year for inventions which have been kept in abeyance.

## ANSWERS TO CORRESPONDENTS.

**BOOKS.**—V. R. G., *Hartford*. Your best method of ascertaining the value of the books you mention is to enquire of a firm of booksellers who specialise in gardening works, such as Messrs. Wheldon and Wesley, 2, Arthur Street, New Oxford Street, W.C.2.

**CARNATIONS DISEASED.**—W. H. D. The disease on your Carnations is caused by a fungus which appears to be new to this country. We understand that a description of the disease will appear in a forthcoming number of the *Journal of the South-Eastern Agricultural College, Wye, Kent*, which you should apply for. In the meanwhile, all the affected plants should be destroyed by burning.

**NAMES OF PLANTS.**—S. I. 1, *Leucophyta Brownii* (syn. *Calocephalus Brownii*); 2, *Veronica speciosa* var. *Veitchii*; 3, *Veronica* species, probably a variety or hybrid of *V. salicifolia*; 4, *Begonia* species; 5, *Senecio laxifolius*. W. C. *Cornus capitata*. Old Reader. 1, *Thymus Chamaedrys* var. *lanuginosus*; 2, *Lycium chinense*; 3, *Coton-easter glaucophylla*; 4, *Pyracantha augustifolia*. D. G. 1, *Viburnum Opulus*; 2, *Gaultheria* sp.; cannot name without flower; 3, *Asplenium Coterach*; 4, *Erythrina* sp.

**PRESERVING INSECT PESTS.**—J. H. S. The common insect pests belong to many different groups of insects, each requiring different methods for preserving them. In addition, the larval and adult stages require different treatment. We advise you to obtain *The Insect Hunter's Companion*, by the Rev. J. Greene, a small and inexpensive book. There is also a very valuable Appendix by L. N. Staniland which should be included; these authorities will supply you with all the information you need.

**Communications Received.**—J. O. H. (Thanks for 9d. for R.G.O.F. Box).—S. J. R.—A. T. H.—C. E. P.—M. T.—Sussex.—H. W.—C. D.—G. N. H.—A. T. J.—F. H. W.—F. M. L.—A. A.—E. G. F.—H. M. N. W.—W. P.—J. B. A.—E. A. B.—G. R.—M. S. H.—J. R.—J. H. W.

Heather, white, per doz. bun.	6	0-9 0			

REMARKS.—Richardias (Arums) and Lilium longiflorum have been the scarcest subjects since Friday last, and prices are higher now than for some weeks past. All white blooms are more valuable and high prices are likely to be maintained, owing to the finishing of Chrysanthemums. More Daffodils, yellow Narcissus and Tulips are on offer, and these flowers are finer in quality; increased supplies of yellow and white Narcissus are being received from the Channel Islands. The cold weather of last week checked the supply of Carnations during last week-end and prices were generally firmer. Of the Roses from home-growers, Columbia is the best in its class; Madame Butterfly and Richmond are only medium in quality. The blooms of the new crop are expected to be available shortly. The first consignment of Narcissus ornatus was on sale this morning.

The few Snowdrops that have been available during the past week have sold freely at high prices; better supplies were to hand this morning. White and mauve Lilac is arriving from Holland in excellent condition, also some fine sprays of Prunus triloba. Small consignments of Lily-of-the-Valley on roots, and large supplies of Tulips have been received from French growers during the past week. Supplies have been more plentiful from the South of France. Paper White Narcissus is more in demand and its prices are rising. Acacia (Mimosa), Anemones, Ranunculus, single Violets and large bunches of Parma Violets are arriving in much better condition, and all coloured blooms are easier in price. Marigolds are selling freely. Yellow Marguerites are wanted but only a few have been received in the market, and these were in poor condition.

REMARKS.—Trade has been spasmodic during the past week, most days being very quiet with an occasional busy hour. Peaches and Plums comprised the bulk of the South African shipments of fruits, the quantities of which increase each week. The demand for these fruits is fairly good. The Apple trade is steady; stocks of imported Apples are heavy, yet their prices keep firm. English Bramley's Seedling are more plentiful and inclined to be cheaper. Hothouse Grapes are scarce and dear, and there is a good demand for both English and Belgian Grapes. Oranges are a better trade and are quoted dearer. Forced vegetables remain in firm demand, and the prices for French Beans, Asparagus and new Potatoes are comparatively high. Salads are plentiful and show some variation in prices. The colder weather checked supplies of Mushrooms, but at the time of writing the quantities show some slight increase. Forced Rhubarb is now a leading line, although at the moment it is not so popular as the growers could wish, the low price of Apples doubtless having a retarding effect on the demand. Cauliflowers from Cornwall and Western France are selling slightly better as compared with last week. Cucumbers remain very scarce and dear. Seakale is arriving in better supply and the prices are lower. Green vegetables are a moderate trade and could show some improvement. The first arrival of the season of Canary Island new Potatoes are due this week. Trade in old Potatoes is satisfactory and quotations are steady.

## GLASGOW.

Restricted supplies of cut flowers were chiefly responsible for the maintenance of prices during the past week. An increased number of varieties of Tulips were available and were readily disposed of at the following values:—William Pitt, 2/- to 2/6 for 6's; Bartigon, 2/- to 2/3;

Ibis and Flamingo, 1/4 to 1/8; Couronne d'Or, 1/2 to 1/6; Prince of Austria and William Copland, 1/- to 1/3; Murillo and Thomas Moore, 10d. to 1/3. King Alfred Daffodils were worth 2/- to 2/6 per dozen; and Golden Spur and Henry Irving, 1/- to 1/2; while Narcissus ranged from 4/- to 6/- per dozen bunches; and Hyacinths, 1/- to 1/3 for 3's. Dunstable growers are still providing a few Chrysanthemums, of which Heston White made 7d. to 9d. per bunch, Favourite 9d. to 1/-, and Winter Cheer 8d. to 10d. There were no Roses on sale, but Carnations sold at 3/6 to 4/6. Violets realised 1/6 to 2/-, and Snowdrops, 2/- to 3/- per dozen bunches. Asparagus made 9d. to 1/6 per bunch, and Smilax, 1/- to 1/6.

Business in the fruit market was quiet and featureless. Apples showed no perceptible change, but Oranges are a little cheaper. Jaffa 144's being down to 12/6 per case. Prices for Arizona seedless Grape Fruit averaged 25/-; Blue Goose brand ranged from 25/- to 30/-; other Florida marks realised 25/- to 28/-; and Porto Rico, 20/- to 24/-, Belgian Grapes were worth 2/6 per lb. and Scotch-grown Gros Colmar, 3/6. Rhubarb was cheaper at 30/- to 32/- per cwt.

In the vegetable section French Beans realised 10/- per box; Small Lettuces made 1/6 to 2/- per dozen, and large, 3/- to 3/6. Onions were dearer at 14/6 per case (5's), and 6/6 per bag.

## THE WEATHER IN DECEMBER, 1926.

December was a very dry month, winds from the south-erly points being remarkably scarce. Westerly airs were nearly twice as frequent as usual, and currents from all north-directions unduly prevalent. It was a quiet month, however, the mean barometric pressure being decidedly higher than in any previous December during the fifty-five years' history of the Southport Observatory. The mean temperature was 40°, or one degree above normal. Rain fell on sixteen days, or three fewer than usual, giving a total of only 1.16 inch, a deficiency of 2.04 inches. There was an aggregate of forty hours of sunshine, or four hours above the average. Ground frost occurred on thirteen nights, and hail and fog on three occasions. There was no snow, and only one gale.

The past year was unusually warm and calm, with a particularly good summer. The first four months were dull but abnormally mild. July was the hottest July on record, and August and September were also very warm. Severe frost occurred in October, and it was a singularly wet November. The year's mean temperature was 49.8°, being 1.5° above the normal. Sunshine totalled 1,474 hours, or 57 hours less than the average. The year's rainfall was 34.84 inches, or 1.73 inches above the normal. Joseph Barendse, F.R.Met. Soc., The Fernley Observatory, Southport.

## GARDENING APPOINTMENTS.

Mr. G. Woods, for the past three years gardener at Rousham Hall, Bury St. Edmunds, as gardener to Major ASHLEY DODD, Otley House, Otley, near Ipswich. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

### LEAF BLISTER ON PEACHES AND NECTARINES.

#### "MEDELA"

THE fungus causing blister and curl of the leaves of the Peach, Nectarine and allied trees will be familiar to all gardeners. For this disease it is necessary to spray *before the buds open*, and the success of "Medela" as a specific for preventing attack has been its own recommendation, and it is only necessary to remind those interested to obtain "Medela" NOW, before the opportunity for spraying has passed. "Medela" should be diluted 1 part to 20 parts soft water. 1-quart cans, 3/6;  $\frac{1}{2}$ -gallon, 4/6; 1 gallon, 7/-; 2 gallons, 11/6; 5 gallons, 25/6.

*Carriage and Packing free.*

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to advertisers of vacant situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.*

### SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required; but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 1d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid it will appear the following week, unless countermanded in the meantime.*

### PRIVATE.

**HEAD GARDENER**, could manage gentleman's estate; highest credentials; over 30 years' practical experience all branches; garden modelling, landscape work, alpine, herbaceous, rock and water gardening, shrubberies, sub-tropical, Roses, ornamental work, fruit, vegetables, Tomatoes, general greenhouse work. reduces the fuel bill and saves labour.

Estimates on application Free.

## The Butcher does not mend your watch

Typical Duncan Tucker Glasshouse

Can you imagine a man going into a Butcher's shop to have his watch mended? Hardly, yet there are plenty of men willing to jeopardise the safety of their Glasshouse by taking risks with it. They will frequently try to get their repairs done by carpenters or glaziers instead of relying on the experts. William Duncan Tucker and Sons Ltd. know all there is to know about Glasshouses—constructive and repair work alike. They have known for nearly a hundred years and their experience as specialists enables them to render invaluable assistance to hundreds of Glasshouse owners.

## COLOUR PLANNING OF THE GARDEN

By G. F. Tinley and others, with an  
introduction by Miss Gertrude Jekyll.

FIFTY COLOURED PLATES

Price 42/- net (plus postage 1/-)

Colour in the garden! After the dark,  
dull winter, we all cry out for this.  
In this unique volume, three hundred  
lovely flowers are grouped and illus-  
trated in their own natural colours,  
and thousands of other plants are fully  
described for the benefit of all who  
wish to have a garden of their  
favourite hue.

**GARDENERS' CHRONICLE  
LIMITED**

5, Tavistock Street, Covent Garden, W.C.2

# CALENDAR OF GARDEN OPERATIONS

Price 2/6, post free 2/10.

The CALENDAR OF  
GARDEN OPERATIONS  
is indispensable and un-  
rivalled, because it represents  
the accumulated experience of  
over half-a-century. Origin-  
ally compiled by Sir Joseph  
Paxton, it has been re-  
vised and enlarged by the

staff of The Gardeners'  
Chronicle until it is  
now as nearly perfect a  
gardening guide as any that  
exists. Its claim to be a  
"calendar" is undoubted,  
as the work to be done is  
arranged under the heading  
of each month.

**THE GARDENERS' CHRONICLE, Ltd., 5, Tavistock Street, London, W.C. 2**

The picture on the right shows a corner of our Exhibit of Seedling Potatoes staged at the Royal Horticultural Society's Meeting on February 23rd, 1926. In appreciation of this exhibit we received the following communication from the Secretary of the Royal Horticultural Society:—

"I am directed by the President and Council to express their appreciation of the remarkable exhibit of Potato Seedlings which you staged at the Show on Tuesday last, and to say that the Council has a very high opinion of the work which you have done and are doing in connection with the breeding of Potatoes."

This year we are introducing the following two new immune main-crop varieties. The illustration on the left shows a row of **Glasgow Favourite** Potato grown by the side of another main-crop variety—tubers of **Sutton's Perth Favourite**. The demand for Sutton's Seed Potatoes continues to increase, and intending buyers are advised to indicate their requirements for the season without delay.

*Price lists of Sutton's Seed Potatoes can be obtained free, by return of post.*

## SUPPLEMENT PLATE.

Forsythia intermedia.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39° 0'.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, February 2, 10 a.m. Bar. 30.1, Temp. 40°. Weather, Sunny.

blue Lupins and the like—may also be practised. A third means employed largely by market growers is to incorporate with the soil organic refuse—wool waste and the like—which material, gradually undergoing decay in the soil, may help to improve its texture beside yielding up slowly a certain amount of plant food. The second aspect of manuring, the supply of "plant foods," is fortunately easier to satisfy than ever it was. The plants' requirements of nitrogen, potash and phosphates may be readily met by the use of appropriate artificial fertilizers, and it is certain that a more extended use of artificial fertilizers in private gardens would result in larger crops. Needless to say, it has to be remembered that artificial manures do not add to the real estate of the soil—that is, do not make a permanent addition to its fertility. They are like a current account. As a sum is paid into the bank and drawn out again, so the sulphate of ammonia or nitrate of soda added to the soil is drawn out by the plant, leaving the soil at best no worse off than it was before. It has been realised recently that the standard quantities of nitrogenous, potassic and phosphatic manures, which are usually recommended, may not, after all, represent the last word in scientific manuring; and that it may be possible to obtain larger yields by increasing the quantities. Nevertheless, as gardeners know, caution has to be exercised in the use of artificials, for an excess of a soluble fertilizer may do much harm. No one should however, be deterred by this fact from a regular use of artificial manures. The main purpose, however, of these articles, the first of which appeared in our issue of January 22, is to suggest that every young gardener should realise what all good gardeners understand, namely, that soil management is one of the most important of the gardeners' arts. That the soil—a complex of physical, chemical and biological factors—is constantly undergoing change. That it tends to wear out and requires repair, and that to keep it in full fertility requires vigilant observation and a knowledge of the ways in which soil fertility may be enhanced or impaired. Once the gardener has learned these principles he will find little difficulty in applying them and the result will be larger crops, and, in the long run, less work. For maintenance is always cheaper than repairs. Anyone who can make a soil fertile can keep it fertile.

hands of the printers shortly. Pritzel's *Iconum Botanicarum Index* has also reached the stage when publication can be considered, and the Council hopes to be able to make a definite announcement during the present year. The Society spent the very considerable sum of £12,000 on Wisley during 1926; new features have been added to the gardens, some of which are referred to by our correspondent on page 101. Apparently the trials are now to be included under the scientific work of the gardens, and we learn that Dr. Darbishire has continued his investigations in green manuring; Mr. G. F. Wilson has compared the efficacy of sprays against insect pests; Mr. Dowson has studied the disease of *Sclerotinia Narcissi* and investigated another species of *Sclerotinia* which attacks *Antirrhinum* and other garden plants, beside continuing his investigation of *Carnation stem-rot* and a disease of China Asters and *Calceolarias*. The President, Lord Lambourne, has made a gift of his portrait to the Council, which was presented to him by the Fellows of the Society and friends. In view of the immense and steady growth of the Society and its widened sphere of activity, the Council has decided to amend the Charters of 1809, 1860 and 1899, together with the bye-laws. The special shows to be held during 1927 include the London Daffodil Show, the Spring Show at Chelsea, the Amateurs' Show on June 28, the Vegetable Show in September, the Autumn Show at Holland Park Hall, a special Fruit Show, which will be held on one day only this year and not on two as heretofore, and a special Show of Soft Fruits and Stone Fruits on July 19 and August 3, respectively. The annual meeting will be held on Tuesday, February 8, at 3 p.m.; the agenda includes a resolution by Mr. Robert Fife that "the special trials of Roses now being conducted at Wisley, be abandoned."

**Our Supplement Plate.**—The Supplementary Illustration presented with the present issue depicts a clump of *Forsythia intermedia* in flower at the Royal Botanic Gardens, Kew. *F. intermedia* is supposed to be a hybrid between *S. suspensa* and *F. viridissima* and flowers before the latter parent and immediately after *F. suspensa*. The golden-yellow flowers of this shrub, produced in clusters, provide colour in the garden when few other subjects are in bloom, hence they are doubly welcome, and they remain attractive for a considerable time. Some of the *Forsythias* are of a rambling habit and adapted for training against walls or furnishing supports to arbors, pergolas, etc., but the one illustrated has a somewhat bushy habit and is more suited to grouping on lawns. The best effect is obtained by allowing the long, arching growths to remain; therefore the plant requires little or no pruning.

**Modern Methods of Marketing Fruit.**—Mr. H. V. Taylor, Commissioner of Horticulture, delivered an address on "Modern Methods of Marketing Fruit," before the members of the Farmers' Club on the 31st ult. Mr. Taylor stated that our present markets are now within easy reach of orchards abroad, and not only are we receiving supplies of hard fruits, such as Apples and Pears, but also soft fruits, and amongst them, Strawberries. He pointed out that the wholesale and retail buyers of fruit are able to make their choice of the products of the world's orchards, and only those which are well-graded and packed are in demand. Home growers have been advised for many years to adopt better methods of grading and packing, but the grower who has graded and packed well has reaped no advantage because of the salesmen's method of averaging prices. This, however, Mr. Taylor stated, will be quite different now that the Horticultural Produce (Sales on Commission) Act has been placed on the Statute Book, for salesmen will now have to furnish particulars to the grower, showing the exact prices at which his produce is sold, and, said Mr. Taylor, it is hoped that growers practising grading will now have returns which will show clearly the superior market value of the graded produce. In the countries where grading is practised the inferior fruits are utilised for the making of by-products and if fruit packing stations are established in our

**Royal Horticultural Society.**—The membership of the Royal Horticultural Society increased by over 1,400 in 1926, and the year generally was a very prosperous one, so far as the Society is concerned. As set forth in the Report for 1926, issued in the *Book of Arrangements* for 1927, the total income amounted to £56,503 16s. 9d.; the assets include investments, £46,851 13s. 2d., and a general reserve fund of £68,000. One of the outstanding events of the past twelve months was the laying of the foundation stone of the new hall, which the Council expects to have available for use in the summer of 1928. The need for a much larger hall than the present one shows the extraordinary success of the Society in the last decade; those who remember the fortnightly meetings and exhibitions in the old Drill Hall will realise the marvellous progress the Society has made since then. We are glad to see that the Council is resuming the conferences on special flowers which some few years ago were a feature of the Society's work and attended with great success. The decision is to hold a conference on Primulas in 1928, and a conference on Rhododendrons in 1929. The long-overdue catalogue of the Lindley Library, which now contains over 12,000 volumes, is nearly complete, and will be in the

**HUMUS**, which comes from the decaying remains of once living things, is, in a sense, the arbiter of soil fertility. Without it, although a soil may be made to grow crops, it will be a continual and unsuccessful struggle to maintain any high degree of fertility. With a good supply of humus constantly augmented, the fertility of the garden will remain and increase. How to supply and augment the humus is, of course, a difficult question to answer. Where farmyard manure is available in large quantities the problem does not arise. But there are few gardeners who are so fortunate as to be able to secure adequate supplies of stable manure. The scarcity may be supplied to some extent by converting all garden refuse into organic manure, and as our readers know, this may be done by means of "Adco"—a preparation of micro-organisms which set going decay and so order it that the final product is humus. Green manuring—the digging in of catch crops, Mustard, Vetches,

fruit growing centres, the culled fruits could be used for the making of vinegar, cider, etc., whilst some might be canned and small Apples used for the making of Apple rings. Canning would help to overcome the difficulty of gluts, and Mr. Taylor stated that the canning of Victoria Plums and Damsons, Strawberries and large Gooseberries should result in traders securing a large and important export trade. In 1926 a National Food Canning Council was formed, consisting of fruit growers, steel plate manufacturers, can makers, brokers and distributors of canned fruits, with a view to developing and organising on sound lines a really successful industry.

**Hardwick House, Bury St. Edmunds.**—Many, especially among the older generation of gardeners, will hear with regret that this beautiful mansion is now being demolished, and the beautiful Italian Garden destroyed. It will be recalled that Mr. D. T. Fish was gardener at Hardwick House for a number of years, and was a frequent contributor to the gardening papers. The many greenhouses have been pulled down, the turf has been stripped off the lawn, and the outstanding feature of the garden practically destroyed. There still remain the Yew trees in the Italian garden, as well as a beautiful Cedar on the lawn, with a girth of thirty feet. Close to this Cedar is a fine symmetrical copper Beech, said to be one of the first brought to England, and planted in 1760. It is hoped that these trees will be spared. Most of the pleasure grounds, in which there are some beautiful Coniferous trees and a good collection of shrubs, have been sold to a gentleman who is building a large house in the vicinity of the kitchen garden, so that a fair portion of the beautiful grounds and what may be described as a bird sanctuary will be retained. It may be remembered that the novelist "Ouida" lived in Bury St. Edmunds and delighted to visit Hardwick to listen to the songs of the nightingale and the blackbirds. In the beautiful park most of the trees, among which are a number of copper Beeches, are being felled for timber, and the mansion itself is now being demolished.

**The Award of Garden Merit.**—The *Journal* of the Royal Horticultural Society for January, 1927, gives a list of six additional plants to which the Award of Garden Merit has been granted. In the *Journal* for November three plants were recorded as having received this award in 1926, and of those in the new *Journal*, *Colchicum speciosum album* is stated to have received the award on October 6, 1924, and *Pyracantha coccinea Lalandei* on December 8, 1925; it seems as though these were overlooked in the preceding *Journal*. The other plants are *Cistus x cyprius*, *Potentilla fruticosa Vilmoriniana*, *Helianthemum hybrids* and *Anagallis Philippii*. Probably the most useful of all these plants is *Pyracantha coccinea Lalandei* which is an extremely popular plant in gardens. *Anagallis Philippii* is the first annual to receive this award. This *Anagallis* has blue flowers with a red ring in the throat. It is often confused with *A. Breweri*, a species with red flowers. Mr. F. J. Chittenden has contributed short descriptions of each of the several subjects.

**London Parks Superintendents.**—A general meeting of Park Superintendents will be held at the Royal Horticultural Society's Hall, Vincent Square, Westminster, S.W.1, on Tuesday February 8, 1927, at 7.30 p.m., for the purpose of forming a branch of the Association for the London district. Addresses will be given by the President, Mr. W. W. Pettigrew, V.M.H., and other members of the Association. A hearty welcome will be extended to all interested in this branch of the horticultural profession.

**Director of the Glasgow Parks.**—The Parks Committee of the Glasgow Corporation has unanimously agreed to recommend that Mr. William Besant, the present Assistant-Director, be appointed to the position of Director of Parks in succession to Mr. Edward Matthews. Mr. Besant was appointed Assistant-Director in 1923. Prior to that he was for two years Curator at Kelvingrove Park and had held important positions at Castle Kennedy, Hopetoun House, Kew, and Errol Park, Perthshire.

**Mr. H. V. Taylor.**—In last week's issue we announced the changes in the Horticultural Department of the Ministry of Agriculture whereby Mr. W. G. Lobjoit retired from the office of Controller of Horticulture as from the 31st ult., and Mr. H. V. Taylor assumed the new office of Commissioner of Horticulture on the first of the present month. Both Mr. Lobjoit and Mr. Taylor have gained the confidence of horticulturists during the past six years, for they have done excellent work at the Ministry, and we look confidently to Mr. Taylor to continue to uphold the interests of horticulture in the future. Mr. Taylor is especially fitted by his earlier training and experience for the post. He may be said to be a son of the soil, for his father is a Somerset farmer and fruit-grower. His earlier practical association with the land doubtless impressed upon him the needs of growers, whilst his scientific training especially fits him to consider cognate questions, apart from practice. When Mr. Taylor joined the old Board of Agriculture in 1913 he had won the Diploma of the Royal College of Science

MR. H. V. TAYLOR.

and graduated with first-class honours, B.Sc., at the London University. Very shortly afterwards came the Great War, and Mr. Taylor was given the important duty of supplying seed Potatoes to the numerous allotment holders who commenced food production all over the country. Enormous numbers of seed Potatoes were handled by the Ministry under Mr. Taylor's supervision, and it is not surprising that he has a special knowledge of this important vegetable. In this connection it may be observed that Mr. Taylor enjoys a high reputation amongst Potato-growers. At a later period of the war, Mr. Taylor was associated with Dr., now Sir Frederick Keeble, as chief of the Plant Disease Section of the Food Production Department. The many horticulturists who have met Mr. Taylor at shows, conferences, trials and other such gatherings know that he is a gentleman with a very pleasant personality, ever ready to do his best for gardeners, and place his experience at the disposal of practical men in helping to solve the many problems that confront them as growers. For some years Mr. Taylor and Mr. Lobjoit have served on the Fruit and Vegetable Committee of the Royal Horticultural Society, and both have rendered very valuable service in the deliberations of the Committee, especially on subjects affecting commercial horticulture.

**Foreign Potato Imports.**—At the annual dinner of the Edinburgh and East of Scotland Potato Trade Association, held on the 26th ult., under

the presidency of Mr. T. A. Scarlett, J.P., the toast of "The Association" was proposed by Mr. Harry Hope, M.P., who, in the course of his remarks, said he had always thought that it would be much in the interests of Potato-growers, and consequently of the whole industry of agriculture, and in keeping with the interests of consumers, if the importation of foreign Potatoes was made under licence. He meant that in years of scarcity the foreign Potatoes should come in and be available for public use, but in years of plenty, when there were enough Potatoes at home to feed our own population, the imports of the foreign growers should be regulated so that the home grower would not make a serious loss by his legitimate industry. If this principle were put in practice the result would be that growers would be able to plant a more regular and consistent acreage under Potatoes, and that thereby the consumers in this country would be safeguarded in getting a full supply of Potatoes at an equitable price. The Potato was, perhaps, the only agricultural crop which could be grown in sufficient quantity to feed our own population, and therefore these foreign imports are only required when the home crop is more or less a failure.

**The Storm in Scotland.**—Apart from the lamentable loss of life and vast material damage done in cities, towns and villages, writes our northern correspondent, the terrific wind-storm which swept over Scotland during last week-end drew a heavy toll from Scottish woods and plantations. Beginning on Thursday, January 27, the full force of the wind reached its climax on Friday afternoon, when a velocity of 102 miles per hour was registered at the famous Coats Observatory, Paisley. The effect such a wind-storm would have on woods, especially the more exposed ones, may be imagined, but there were cases where even imagination failed when compared with actual results. From John o'Groats to the English borders, few woods escaped damage and many roads—rail and public—were rendered impassable by fallen trees. There was an amusing side in this respect. There were motorists, very anxious to reach their objectives, who added to their impedimenta large two-handed saws, and when confronted with fallen trees lying across their path, proceeded right away to do the needful on their own behalf. Older folks draw a parallel to this storm in that which swept the east coast of Scotland on December 29, 1879, when the old Tay Bridge fell. There has been nothing to compare with that storm during the intervening years until the one under review. It may also be mentioned that the storm has brought home to proprietors of trees a very important point—their responsibility for damage done to other people's property by falling limbs or the uprooting of such trees. Proprietors in this respect may have some pretty heavy bills to meet for damaged boundary-walls, fences, etc., belonging to their neighbours.

**A Flower Festival in Midwinter.**—In Frankfurt, Germany, a very successful festival has just taken place, which resulted in the local flower shops being raided, and great business being done. It was announced that the local branch of the German Nurserymen's Association would award a prize to the lady who wore, at the festival, the prettiest bouquet or decoration of real flowers, and that she would be known as the "Flower Queen." The matter aroused public interest to a quite unexpected extent; the festival has taken a place in the front rank of the season's festivities, and the promoters are fully satisfied with the success of their experiment.

**Denham Demonstration Station.**—The Middlesex Education Committee has published a record of the work of the Denham Demonstration Station during 1926. The Station is maintained by the Middlesex Education Committee as part of their scheme of horticultural education in the county. It consists of about ten acres of land at Rusholt Farm, Denham, Bucks., an estate acquired by the Middlesex County Council for the purpose of small holdings. Trials of special interest in 1926 were those conducted with Runner Beans to show the

comparative results of staked and unstaked plants. The crop from Sutton's A.1. from staked plants was estimated at 792 bushels per acre, whereas in the case of unstaked plants the yield per acre was only 264 bushels. Hackwood Park Success gave an estimated yield of 726 bushels per acre from the staked rows, and only 319 bushels per acre from unstaked plants. In a trial of main crop Potatoes, Great Scot gave the largest yield, 11 tons 17 cwt. per acre, followed by Arran Chief, 11 tons 12 cwt., King Edward VII, 10 tons, Golden Wonder, 9 tons 10 cwt., and Scottish Farmer, 7 tons 12 cwt. The best results with Great Scot were obtained from a dressing of dissolved bones, 3lb., kainit 4lb. and sulphate of ammonia 2lb., the crop in this case being estimated at 13 tons 12 cwt. 16lb. per acre. In the case of Arran Chief, manuring with "Phutophos" 3lb., kainit 3lb., and sulphate of ammonia 2lb., gave the largest yield, i.e., 12 tons 12 cwt. 96lb. per acre. Where no manure was used, the crop in both cases was only just over eight tons per acre. The trials are under the management of Mr. J. Lawson, the superintendent, who will be pleased to make arrangements for anyone interested to visit the Station and inspect the work that is being done there.

#### Rainfall at Tirley Garth, Tarporey, in 1926.

Mr. J. B. Allan, Tirley Garth Gardens, Tarporey, Cheshire, informs us that the rainfall at Tirley Garth Gardens in 1926 amounted to 33.65 inches or .62 of an inch more than in 1925. The heaviest rainfall occurred on July 18, when 1.18 inch was registered. December was the driest month with only .80 of an inch. In November the rainfall amounted to 4.89 inches, this being the wettest month in the year, with twenty-five rainy days. There were two hundred days in which .01 of an inch or more was registered, and one hundred and forty-seven days on which .04 inch or more was registered. The driest spell was from March 11 to March 30, when there were nineteen clear, dry days. The hottest day was on July 13, when the temperature rose to 89° in the shade. The coldest days were on January 13 and December 14, when 13° of frost were registered. The year 1926 was, on the whole, dull and sunless.

**Planetarium at Liegnitz.**—The municipal authorities of Liegnitz, in east Germany, are contemplating the erection of a Planetarium for the town, which would form one of the principal attractions at the forthcoming horticultural exhibition there.

#### The Preservation of the South Downs.

It is hoped that the scheme for the preservation for all time of the South Downs will materialise as a result of concerted action on the part of local town planning authorities. An influential committee is likely to be formed in Brighton and Hove with the respective Mayors at its head to raise the £5,000 still required to ensure the preservation of the Seven Sisters Cliffs between Seaford and Eastbourne. Mr. A. H. Anderson (Chairman of the Downs Preservation Committee) considers that the movement to save the Seven Sisters would not have been started but for the initiative of the Sussex Downsmen.

#### Appointments for the Ensuing Week.

SUNDAY, FEBRUARY 7: Wakefield and North of England Tulip Society's meeting. MONDAY, FEBRUARY 7: Romsey and District Gardeners' Association's meeting. TUESDAY, FEBRUARY 8: Royal Horticultural Society's Committees meet; Annual Meeting at 3 p.m.; Horticultural Club Dinner and Lecture; Jersey Gardeners Society's meeting; Wimbledon Gardeners' Mutual Improvement Society's meeting. WEDNESDAY, FEBRUARY 9: Sheffield Chrysanthemum Society's meeting; Pangbourne and District Gardeners' Mutual Improvement Association's lecture. FRIDAY, FEBRUARY 11: Orchid Club meeting; R.H.S. of Ireland meeting; Post Office Savings Bank Horticultural Society's lecture.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Luminous Plants.*—The phenomenon of phosphorescent dead wood is of very frequent occurrence in some parts of the humid mountainous provinces of India, and I am perfectly familiar with it. At Darjiling, in the Sikkim

Himalaya, during the damp, warm summer months (May to October) at elevations of 5,000 to 8,000 feet, it may be witnessed every night by walking a few yards in the forest—at least, it was so in 1848 and 1849; and during my stay there billets of decayed wood were repeatedly sent me by residents, with enquiries as to the cause of their luminosity. It is no exaggeration to say that one does not need to remove from the fire-side to see this phenomenon, for if there is a log of partially decayed wood amongst the fire-wood, it is almost sure to glow with a pale phosphoric light, if the candles be removed and the fire low. A stack of fire-wood collected near my host's (Mr. Hodgson) cottage, at 7,400 feet elevation, presented a beautiful spectacle for two months, and on

camping in the mountains, I have caused the natives to bring phosphorescent wood into my tent, for the pleasure of watching its soft undulating light, which appears to pale and glow with every motion of the atmosphere; but, except in this difference of intensity, it presents no change in appearance night after night. Alcohol, heat, and dryness soon dissipate it; electricity I never tried. It has no odour, and my dog, who has a fine sense of smell, paid no heed when it was laid under his nose. As far as my observations go, this phenomenon of light is confined to the lower orders of vegetable life, to the fungi alone, and is not dependent on irritability. I have never seen luminous flowers or roots, nor do I know of any authenticated instance, such, namely, as may not be

FIG. 48.—COTYLEDON (ECHEVERIA) MULTICAULIS.

R.H.S. Award of Merit, January 25. Flowers deep red, foliage green and bronze.  
Shown by Cecil Hanbury, Esq., La Mortola. (see p. 89).

passing it at night, I had always to quiet my pony, who strongly objected to it. The phenomenon invariably accompanies decay, and is common on Oak, Laurel (Tetranthera), Birch, and probably other timbers; it equally appears on cut wood and on stumps, but is most frequent on branches lying close to the ground in the wet forests. I have reason to believe that it spreads with great rapidity from old surfaces to fresh cut ones. That it is a vital phenomenon and due to the mycelium of a fungus, I do not in the least doubt, for I have observed it occasionally circumscribed by those black lines which are often seen to bound mycelia on dead wood, and to precede a more rapid decay. I have often tried, but always in vain, to coax these mycelia into developing some fungus, by placing them in damp rooms, etc. When

explained by the presence of mycelium or of animal life. In the animal kingdom luminosity is confined, I believe, to the Invertebrata, and is especially common amongst the Radiata and Mollusca; it is also frequent in the Entomostracous Crustacea, and in various genera of most orders of insects. In all these, even in the Sertulariae, I have invariably observed the light to be increased by irritation, in which respect the luminosity of animal life differs from that of the vegetable. *J. D. H., Gard. Chron., February 7, 1852.*

**Publication Received.**—*Inorganic Plant Poisons and Stimulants*, by Winifred E. Brenchley; second edition. The Cambridge University Press, Fetter Lane, E.C.4. Price, 10s. 6d. net.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley, Park, Bletchley, Bucks.

**Odontoglossum.**—The members of this large family of Orchids are in various stages of growth. Many of the plants are sending up their flower spikes, which should be staked neatly so soon as they become long enough, and protected from damage by slugs and other pests, either by isolating them or wrapping dry cotton wool around the stems. Many pests may be trapped by placing Lettuce leaves on the plant stages. Plants of *O. Edwardii* and its hybrids which have recently bloomed and are at the present time well advanced in growth, should be repotted, if they require it. If such plants are well established and have sufficient rooting space, with compost in good condition, their repotting may be deferred for another season, as they resent being disturbed too often. Free drainage is necessary for all *Odontoglossums*; they succeed in a soft, open compost made up of equal parts good peat, A.I. fibre and Sphagnum moss.

**Repotting.**—Any *Odontoglossums*, either species or hybrids, that have made some two or three inches of new growth and are about to develop new roots, may be repotted if the compost is decomposed or the plant in need of more pot room. Small, weak plants should have their spikes removed so soon as they show, as these plants should not be allowed to produce flowers until they get strong, and then only be allowed to produce two or three blooms. These early, newly-potted plants should be watered with extreme care, as in many cases the material at the top will appear to be dry, whilst that lower down in the pot will be moist and in a suitable condition for the roots. It is by the close attention to these small details that the best results are assured.

**Fumigating.**—At this season, when fire-heat is necessary to maintain the necessary temperatures, the houses should be fumigated periodically as a preventive against thrip and other insect pests.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTEE, Horsley Hall, Gresford, N. Wales.

**Dwarf Beans.**—Where a suitable temperature about 65° can be maintained, a sowing of dwarf Beans may be made in eight-inch pots. Well-crock the latter and cover the drainage material with rough pieces of loam or turf. Prepare a compost consisting of good loam three parts, and old, friable manure, one part, mixed with a small quantity of burnt refuse, a little bone-meal and a dash of soot. Three parts fill the pots with the compost. Sow rather more seeds than will be actually required, and thin the plants to six or seven finally. Cover the seeds with about one inch of soil and water the latter sparingly, keeping it only just moist in the very early stages. When the young plants are about eight inches high, top-dress the roots with rich compost. Place twigs as supports before the growths become too heavy. So soon as pods commence to form, feed the roots liberally with liquid manure; dried blood suits them admirably. Use the syringe freely when the weather is favourable, or red spider may be troublesome. White fly may be kept in check by using a reliable vapour. Grow the plants near to the roof-glass.

**Early Peas and Broad Beans.**—Where warm, well-drained soil is available these crops may now be sown. Choose a day, if possible, when the soil is likely to dry somewhat. For Peas, draw out the drills and scatter a little burnt refuse on the soil. For the present, only round-

seeded varieties should be sown, and they should be scattered somewhat thickly in the rows, thus allowing for a few losses. Dress the seeds with red lead before sowing them, and afterwards cover them with about three inches of soil. Where Peas were sown outside during the late autumn the rows should be watched carefully or enemies will injure the tender growths. Where sparrows are troublesome either place small-meshed netting over the rows or use strands of black cotton. Should cold winds prevail, place twigs or small branches of evergreens alongside the rows. See that adequate supports are afforded the young plants in good time. Broad Beans are best sown in double rows, putting the seeds about six inches apart each way. So soon as the young plants appear above the soil, draw a little earth towards them as a protection.

**Horseradish.**—Where this vegetable is in demand, fresh beds should be made annually in ground that has been trenched deeply and manured liberally with well-rotted dung.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Richardia.**—Plants of *Richardia africana* (*Arum Lily*) which are now in full growth and showing flowers, should be given liquid manure and soot-water in liberal quantities to keep them in a healthy condition. When producing their spikes, the plants will require these stimulants at least twice a week. Where space is available for them to be planted out under glass they thrive and produce flowers in great quantity, but even when planted out and growing in borders they will require some assistance to produce good spathes. A batch of *R. Elliottiana* may now be potted, using receptacles according to the size of the tubers, but here it will be advisable to err on the small size rather than overpot them. Only half-fill the receptacles with compost to allow room for top-dressing when the plants have started to grow freely. The plants may be started into growth in a temperature of 55°, taking every care not to over-water the soil. When they are growing freely, and the receptacles are filled with roots they will require liberal supplies of water and liquid manure. *R. Pentlandii* requires much the same treatment as that advised for *R. Elliottiana*.

**Cyclamen.**—Cyclamens raised from seeds sown last August and transferred to boxes or pans should now be placed singly in small pots. The compost may consist of equal parts of loam and leaf-mould, with a liberal sprinkling of silver-sand to render the soil porous. Old brick, broken very finely, should also be mixed with the soil. A night temperature as near 55° as possible will suit the young plants, which should be fumigated lightly on frequent occasions to keep aphids and mite in check.

**Seed Sowings.**—Seeds that may be sown now in light sandy soil include *Streptocarpus*, *Saint-paulia ionantha*, *Salvias*, *Lobelia tenuior* and *Coleus thyrsoideus*.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Peaches and Nectarines.**—As the days lengthen the flower buds will develop, therefore the work of pruning and training the young shoots and branches should be completed so soon as possible. Some growers do not prune their Peach trees until March, but I obtain equally good results by pruning any time after the beginning of the year. As the fruits are borne chiefly on one-year-old shoots, fan-training is the most suitable method to adopt with a view to keeping trees furnished with bearing wood from the bottom to the top. Trees that were disbudded carefully last summer and relieved of the old fruiting wood should not require much thinning now. All ties and fastenings should be removed

and renewed if necessary. Thin the superfluous shoots and trim off any old snags, etc. Train the main branches evenly, then distribute the young fruiting shoots to fill the space. Three important items in connection with these fruits are not to crowd the trees with useless wood, not to overcrop, and not to neglect the roots. When fastening the young shoots to the walls, allow ample room in the ties for the wood to swell; if the walls are wired care should be taken to prevent the shoots from pressing directly on the wire. A good plan is to pass the tying material twice around the wire before tying the shoot.

**Apricots.**—As these trees flower early in the season, they are very liable to injury by early frosts. The work of pruning and training the branches should be completed at an early date. If the spurs are somewhat crowded a few should be removed annually and suitable young wood trained in neatly at intervals. When top-dressing Apricot trees use plenty of lime and old brick mortar.

**Damsons.**—Care should be taken to keep the heads of these trees from becoming thickets of useless wood. A little timely pruning annually will do much to increase the size of the fruits and cause the trees to crop regularly. Trees which have been neglected should be severely dealt with. Thin the crowded branches, remove any suckers springing from the ground, and give every encouragement to the roots to keep the trees vigorous. Good varieties of Damsons are Farleigh, Bradley's King, Merryweather, one of the largest sorts and of excellent quality; and Prune. Good Bullaces are Shepherd's Golden and The Langley.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Cherries in Pots.**—Those who desire to have a few ripe Cherries in May must exercise patience for the present and hasten the development of the trees later when sun-heat will favour steady forcing, whereas, if mild weather continues, these precocious trees will develop too fast if much fire-heat is used now. When the flower buds begin to swell the mean temperature may range from 40° to 45° at night, and 50° to 55° by day. Always admit a little fresh air and maintain atmospheric moisture by syringing in accordance with the weather. As the days become longer and brighter more air should be admitted by the top and front ventilators, especially if the pipes are warm. The fire-heat should be discontinued at night unless the temperature falls below 40°. No matter how carefully the trees are cleansed green and black fly generally put in an appearance, and to combat these pests the house should be lightly fumigated on two or three occasions, the last preceding the opening of the first flowers. Cherries also do well when planted out in narrow borders, and growers should restrict the varieties to three or four of the best which ripen in succession. Well-managed pot trees last a great number of years, increasing slowly in size, but improving in fertility, provided they are not allowed to become exhausted by overcropping. To prevent this the spurs and blossoms should be thinned freely every year. When the trees are in flower a fairly dry, steady warmth, with the aid of sun-heat and plenty of air will ensure a good crop of fruit.

**Plums.**—These fruit trees start kindly with Cherries, and none but the very best dessert sorts should be chosen for growing in pots or inside borders. Plums should be allowed to develop and ripen their fruits slowly; they will not be hastened, but are a success when started early and allowed to develop through the various stages of their growth steadily.

**The Grape Room.**—Carefully examine the bunches of Grapes at short intervals and remove every faulty berry. See that the room is judiciously ventilated to expel stagnant moisture and examine each bottle and fill it with soft

water as the latter is absorbed by the wood. In damp, foggy weather the room may be kept close, dark and dry enough to prevent mould on the berries. The less fire-heat that is used to maintain a temperature of 40° to 43° the better the bunches will hang until May.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Erigeron.**—This genus includes a number of beautiful species and varieties which are invaluable for grouping in the herbaceous or mixed border. Some, including *E. aurantiacus*, *E. glabellus*, *E. leiomerus*, *E. mucronatus* and the varieties *B. Ladhams* and *Elsie*, vary in height from six inches to fifteen inches and are suited to the rock garden. *E. Coulteri*, *E. Antwerpia alba*, *E. philadelphicus* *Pink Pearl*, *E. speciosus* and its varieties *Merstham Glory* and *Quakeress*, are taller and excellent for the border, the last two being specially fine for filling lawn beds, as they flower with wonderful profusion over a long period. After flowering, if desired, the plants may be lifted, divided and planted in the reserve garden, their places being taken by hardy *Chrysanthemums* or *China Asters* grown in the reserve garden for the purpose.

**Chrysanthemums.**—The hardy varieties of *Chrysanthemums* are indispensable for furnishing beds and borders during late summer and autumn; not the least of their merits being the fact that they may be grown in the reserve garden during the summer and transplanted where they are to bloom. This accommodating habit renders them of immense importance for re-furnishing beds in which early flowering subjects are over, as well as for filling blanks in the mixed border. If not already done, the stock should be propagated forthwith, taking the cuttings from the stock plants that were placed in boxes of soil last autumn and wintered in cold frames. The cuttings are best dibbled into seed-boxes; they will root readily on an open bench or on shelves in a house that is kept fairly close, with a temperature ranging from 44° to 55°. They may also be rooted in cold frames, if no other accommodation is available. As the plants are hardy, they may be planted out-of-doors during March. To ensure a bushy habit they should be stopped several times during the growing season; the amount of stopping will depend on the variety and the purpose for which the plants are required. The following varieties are all excellent for bedding purposes:—*Almirante*, *Red Almirante*, *Dick Barnes*, *Crimson Marie Masse*, *Polly*, *Crimson Polly*, *Horace Martin*, *Goacher's Crimson*, *Flora*, *Normandie*, *Sanctity*, *Pluie d'Argent* and *Verona*.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Sweet Peas.**—If not already planted, Sweet Pea seeds should now be sown in pots and germinated in a cool house. From three to five seeds are sufficient for each three-inch pot. The soil employed should be good turfy loam with the addition of sand and leaf-mould. The seeds may be steeped or soaked in water for twenty-four hours before sowing them to hasten their germination, but if the soil is used in a moderately moist condition and watered so soon as the seeds are sown, the plants will be very little, if any, later than if the seeds are soaked. A Belfast firm of seedsmen supply what they term "Energised" seeds, and the claim is made that by using these specially prepared seeds germination is advanced by nearly a week. If this hastening process does not affect the vigour and after life of the plants raised from these "energised" seeds, it will be of great service to growers, and may possibly be extended to many other seeds that are notorious for slow and irregular germination.

**Trenches for Sweet Peas.**—The preparation of the trenches or ground intended for growing Sweet Peas should now be proceeded with in

order that the soil may have time to settle before planting time arrives. It is advisable with Sweet Peas as with most other crops, to change the site on which they are grown frequently, and where this can be done, it will be found that less elaborate preparations of the ground are necessary; it will be sufficient to double-dig the soil, add a liberal amount of manure and, before planting, give the top spit a generous dressing of bone-meal and wood-ash. Where, from lack of space or other causes, it is desirable to grow Sweet Peas on the same site year after year, failure is almost inevitable unless the soil is renewed from time to time, and this may be readily accomplished by taking out the old staple to a depth of two feet and substituting soil from the vegetable quarters, adding manure, etc., as the work proceeds, and mixing the whole thoroughly. The old

### INDOOR PLANTS.

#### ANOPTERUS GLANDULOSUS.

This Tasmanian shrubby member of the Saxifragaceae is hardy only in sheltered gardens of the west. It forms a bush several feet high, with short-jointed, terete stems, clothed with whorled clusters of from four to seven glabrous, dark green, ovate leaves, six inches long.

The shoots bear, at their apices, erect racemes some few inches long, with twelve or more six-petalled flowers, loosely arranged on the upright spike. The blooms are pinky-white, and half-an-inch in diameter.

*Anopterus glandulosus* usually flowers in

FIG. 49.—ACACIA HANBURYANA.

A natural hybrid between *A. podalyriaefolia* and *A. Baileyan*. Flowers yellow. Shown by Cecil Hanbury, Esq., La Mortola. (see p. 89).

soil may be put where the fresh is taken from, and although practically exhausted so far as the growing of Sweet Peas is concerned, will suit many other crops to perfection.

**Rhubarb for Succession.**—Where Rhubarb is in constant demand a succession to the earlier supplies forced under cover may be easily procured by covering selected crowns where they are growing with barrels or boxes surrounded by fermenting materials, such as stable litter and freshly-gathered leaves. Empty Apple barrels with moveable lids make splendid covers for Rhubarb, as the stalks may be kept under observation and readily reached when ready for pulling. The earlier forced crowns should be placed outside so soon as the crop has been gathered, and if allowed a few weeks to recover, they will be useful for making fresh plantations.

the cool greenhouse in January. It may be grown in a large pot, but is more satisfactory when planted in a well-drained border of fibrous loam and peat.

#### AGLAONEMA COSTATUM.

SHALLOW pans, six inches in diameter, are suitable receptacles for the cultivation of this ornamental foliaged, prostrate growing, tropical Aroid.

It forms a tangled mat of fleshy stems with tufts of comparatively large leaves of a glossy green with a white midrib, and the leaf-surface is irregularly blotched with white.

This plant may be increased by division in spring. As it grows only a few inches high it is a suitable subject for furnishing the front stage in the plant stove, and will retain its fresh colouring throughout the year. F

## ORCHID NOTES AND OLEANINOS.

### THRIPS ON ORCHID SEEDLINGS.

A NUMBER of species of thrips infest glass-houses, including *Parthenothrips dracaenae*, Heeg., which occurs on Palms and *Aspidistra*; *Heliethrips haemorrhoidalis*, Behé., on Palms and *Azaleas*; *Thrips tabaci*, Lind., on a great variety of plants, including Carnations; and *Heliethrips femoralis*, Reut., on Orchids.

Most of these have been collected by the writer in glasshouses in England or in Belgium. They may be introduced into glasshouses as adults in the soil, or immature stages about the plants.

In connection with the case cited by your correspondent, Mr. R. Brooman White (p. 18), it is probable that fresh infestation from out-of-doors takes place in his glasshouses, and as regards control, the subject is best tackled in at least two ways in order to control the pest on his Orchids. Firstly, reducing the infestation in the houses under consideration, and secondly, securing that new supplies of soil and plants, etc., taken into the glasshouse shall be, as far as possible, free from the pest. During the past year a considerable amount of work has been done in the United States, the British Isles and on the Continent of Europe with calcium cyanide, and it is now definitely established that this insecticide can be used with success for the control of thrips. Used at the rate of one-third-of-an-ounce per one thousand cubic feet, calcium cyanide gives a fair control of the adult thrips, but does not destroy the immature insects. A series of fumigations is therefore necessary, so as to destroy the pests as they reach maturity, and before they have time to oviposit.

With seedling Orchids, it would be advisable to start a series of fumigations with a dosage of one-eighth-of-an-ounce per one thousand cubic feet, and gradually increase this dosage when it is seen that the plants react favourably. In connection with keeping down re-infestation of the glasshouses, this would be a question of adapting the calcium cyanide treatment. The granular form of this insecticide may be used as a soil fumigant in sufficiently large quantities to kill any hibernating thrips, i.e., at the rate of one pound per twelve cubic feet.

In addition to the soil fumigation, a periodic fumigation of the glasshouse in which the seedlings are raised would probably keep the thrips well under control, so that they do not obtain access to the Orchid seedlings to cause injury.

Although control measures applied directly to the seedling Orchid might yield some temporary success, the wider scope necessary for the use of calcium cyanide would be more likely to yield general control, and gradually eliminate losses caused by the pest. *Herbert W. Miles, M.Sc.*

## ALPINE GARDEN.

### ESCALLONIA RUBRA PYGMAE.

THE little shrub bearing the above name has proved a most delightful rock garden subject. It is evergreen, of a close, neat habit, and does not exceed one foot in height. The bright, rose-crimson flowers, nearly half-an-inch long, are borne profusely from soon after mid-summer to late autumn.

This dwarf form of *Escallonia rubra* appears to be perfectly hardy and easy to cultivate in any light soil and open situation. It is a desirable addition to a collection of dwarf shrubs. *J.*

### HELICHRYSUM FRIGIDUM.

MR. RALPH ARNOLD'S notes on this plant (p. 489, vol. LXXX) were of great value to the many who have failed with this exquisite little alpine. I may, perhaps, be allowed to supplement his note by stating that *H. frigidum* does well in a moraine or scree, which appears to give the conditions it requires. I have grown it successfully on such a moraine. It was composed in the usual way with whinstone chips above the rough stones, and, with some old

mortar rubbish and a mere modicum of soil and sand on the surface. The moraine sloped gently to the south, and *H. frigidum* grew exceedingly satisfactorily. Those who can give this moraine treatment will find it very beneficial to a number of plants which are difficult under ordinary conditions, and it may specially be recommended to those whose gardens have a heavy winter rainfall. *S. Arnott.*

### PRIMULA PUBESCENS.

*PRIMULA pubescens*, which includes a wide range of natural hybrids from *P. hirsuta* × *P. auricula*, ranks among the early-flowering Primulas. Of the various plants, some lean towards the garden *Auricula* and others show characters of *P. hirsuta*. They are free-flowering, delightfully fragrant, bold of colour, and vary in height from three inches to five inches.

A rich, sandy loam and good drainage are essentials to the successful cultivation of this *Primula*, and water should be used sparingly during the winter.

A few of the best of these hybrids are *P. pubescens alba* (syn. *P. nivalis*), rather a rare plant; Mrs. J. H. Wilson, lilac-purple; The General, terra-cotta; The Professor, rich claret, and Ruby, ruby-red. *S. D. R.*

## HARDY FLOWER BORDER.

### INULA HELENIUM.

BOLD and effective plants are frequently needed for the back of large borders or the wild garden, and they are specially desired for furnishing a display in the later months of summer. *Inula helenium* is a bold flower of this description.

Like most tall plants, it requires good soil if full satisfaction is to be derived from its boldness; grown in ordinary garden soil, its general stature is about six feet or a little more, but if given good, fertile loam, well enriched with manure and not too dry, it will attain a height of eight feet. At this stature it is a most imposing plant, after it has had a year or two to develop.

The plant has large, massive, imposing leaves, and large heads of yellow flowers, which generally begin opening in July and continue into September.

For propagating purposes large plants may be divided, but a stock may be raised from seeds. Planting may be done in spring. *S. Arnott.*

## FLOWER GARDEN.

### VERBENA VENOSA.

I WAS pleased to see Mr. Coutts' reference to this plant in his remarks on the Flower Garden, as it shows that this beautiful *Verbena* is still a favourite with some. Although acquainted with it previously, I had not grown it until last year. The plants were placed in seven-inch pots the previous autumn because no other size was available, the intention being to divide them and put them into three-inch pots in the spring. That, however, through stress of work, was not done, and the plants were planted direct from the seven-inch pots without division, at a distance of about two-and-a-half feet apart.

I associated the plants with *Cineraria maritima*, using also some blood-red Beets. The bed was greatly admired and gave good colour long after other subjects had faded.

Strangely, I had intended this year to inter-plant it with *Calceolaria amplexicaulis*, and am glad to see that Mr. Coutts favours this association. I had also intended to put some tall specimens in a bed of pink, Ivy-leaved *Pelargoniums*, which I think would make an agreeable colour scheme.

This plant is nearly hardy, and last winter had only the protection of a cold house from which frost was not excluded. The flowers are suitable for cutting. *William F. Rowles, Hardwick House Gardens, Bury St. Edmunds.*

## ROSE GARDEN.

### ROSES IN CANADA.

BEING in Montreal in November as one of the judges at Canada's National Flower Show, I was very agreeably surprised at the remarkable quality of the Roses staged. In one large group from the Dale Estate, Brampton, Ontario, were over two thousand blooms, beautifully arranged, the bulk with stems 2 feet to 5 feet long, of such varieties as *Souvenir de Claudius Pernet*, *Briarcliff*, *America* (the best of all), *Templar*, *Madame Butterfly* and others, including some superb seedlings which will be heard of later. The Dale Estate, where this beautiful group came from, is the largest and most thoroughly up-to-date flower growing establishment on the American continent, in the opinion of the most competent judges.

Additional fine Rose collections were shown by Messrs. Miller and Sons and Mr. John H. Dunlop, both of Ontario. The Roses were of superior quality to those shown at the autumn exhibitions in the United States. Chrysanthemums and other flowers brought out keen competition at this same exhibition. *W. N. Craig.*

## FLORISTS' FLOWERS.

### CHRYSANTHEMUM LOUISA POCKETT.

FOR several years I have grown this excellent *Chrysanthemum* as a decorative variety, flowering it on the terminal bud, and I know of no other variety that can be depended upon to give such useful results.

Whilst the flowers are pure white from the early crown buds, the late crown and terminal buds are a pleasing delicate pink. Moreover, the plant is slow in developing and does not reach perfection before December, and will last well over Christmas.

By removing the crown buds, a plant will produce from nine to twelve well-shaped blooms on the disbudded terminals, with no trace of an open centre. Even the extreme terminals will produce perfect blooms when allowed to remain, while the stem remains stiff and rigid. Another point in its favour is that it does not become affected with disease readily. *R. Gardner.*

### NEW VARIETIES OF PERPETUAL- FLOWERING CARNATIONS.

THE following new varieties of Perpetual-flowering Carnations have been registered with the British Carnation Society.

*Carnation Colonel Langford*.—A deep cerise-coloured variety. Raised by Lieut.-Col. W. J. Langford, Harefield, Romsey, Hert.

*C. Mrs. Langford*.—The colour of this variety is salmon-pink. Raised by Lieut.-Col. W. J. Langford.

*C. Ruby Glow*.—A variety of ruby-red colour. Raised by Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

### CARNATIONS IN AMERICA.

NOTHING at all sensational is being introduced in America this year in the way of new Carnations. Unquestionably the best is *Sceptre*, raised by Mr. A. A. Pembroke, of North Beverly, Mass. This is a seedling from *Pink Delight*, a little warmer in colour, slightly larger, and much more floriferous. So many as 140,000 rooted cuttings had been sold up till January 1. *Pink Delight* appears to be losing ground; it never attained much popularity in America outside of New England, which latter is, however, the leading Carnation-growing centre in this country.

Laddie still stands supreme in its colour; being a rather shy bloomer it must realise a fancy price to be profitable. *Spectrum*, from Messrs. Dorner and Sons, Lafayette, Indiana, is easily the dominant red to-day.

## ORCHID NOTES AND CLEANINGS.

### THRIPS ON ORCHID SEEDLINGS.

A NUMBER of species of thrips infest glasshouses, including *Parthenothrips dracaenae*, Heeg., which occurs on Palms and *Aspidistra*; *Heliethrips haemorrhoidalis*, Behé., on Palms and Azaleas; *Thrips tabaci*, Lind., on a great variety of plants, including Carnations; and *Heliethrips femoralis*, Reut., on Orchids.

Most of these have been collected by the writer in glasshouses in England or in Belgium. They may be introduced into glasshouses as adults in the soil, or immature stages about the plants.

In connection with the case cited by your correspondent, Mr. R. Brooman White (p. 18), it is probable that fresh infestation from out-of-doors takes place in his glasshouses, and as regards control, the subject is best tackled in at least two ways in order to control the pest on his Orchids. Firstly, reducing the infestation in the houses under consideration, and secondly, securing that new supplies of soil and plants, etc., taken into the glasshouse shall be, as far as possible, free from the pest. During the past year a considerable amount of work has been done in the United States, the British Isles and on the Continent of Europe with calcium cyanide, and it is now definitely established that this insecticide can be used with success for the control of thrips. Used at the rate of one-third-of-an-ounce per one thousand cubic feet, calcium cyanide gives a fair control of the adult thrips, but does not destroy the immature insects. A series of fumigations is therefore necessary, so as to destroy the pests as they reach maturity, and before they have time to oviposit.

With seedling Orchids, it would be advisable to start a series of fumigations with a dosage of one-eighth-of-an-ounce per one thousand cubic feet, and gradually increase this dosage when it is seen that the plants react favourably. In connection with keeping down re-infestation of the glasshouses, this would be a question of adapting the calcium cyanide treatment. The granular form of this insecticide may be used as a soil fumigant in sufficiently large quantities to kill any hibernating thrips, i.e., at the rate of one pound per twelve cubic feet.

In addition to the soil fumigation, a periodic fumigation of the glasshouse in which the seedlings are raised would probably keep the thrips well under control, so that they do not obtain access to the Orchid seedlings to cause injury.

Although control measures applied directly to the seedling Orchid might yield some temporary success, the wider scope necessary for the use of calcium cyanide would be more likely to yield general control, and gradually eliminate losses caused by the pest. *Herbert W. Miles, M.Sc.*

## ALPINE GARDEN.

### ESCALLONIA RUBRA PYGMAE.

THE little shrub bearing the above name has proved a most delightful rock garden subject. It is evergreen, of a close, neat habit, and does not exceed one foot in height. The bright, rose-crimson flowers, nearly half-an-inch long, are borne profusely from soon after mid-summer to late autumn.

This dwarf form of *Escallonia rubra* appears to be perfectly hardy and easy to cultivate in any light soil and open situation. It is a desirable addition to a collection of dwarf shrubs. *J.*

### HELICHRYSUM FRIGIDUM.

MR. RALPH ARNOLD's notes on this plant (p. 489, vol. LXXX) were of great value to the many who have failed with this exquisite little alpine. I may, perhaps, be allowed to supplement his note by stating that *H. frigidum* does well in a moraine or scree, which appears to give the conditions it requires. I have grown it successfully on such a moraine. It was composed in the usual way with whinstone chips above the rough stones, and, with some old

mortar rubbish and a mere modicum of soil and sand on the surface. The moraine sloped gently to the south, and *H. frigidum* grew exceedingly satisfactorily. Those who can give this moraine treatment will find it very beneficial to a number of plants which are difficult under ordinary conditions, and it may specially be recommended to those whose gardens have a heavy winter rainfall. *S. Arnott.*

### PRIMULA PUBESCENS.

*PRIMULA pubescens*, which includes a wide range of natural hybrids from *P. hirsuta* × *P. Auricula*, ranks among the early-flowering Primulas. Of the various plants, some lean towards the garden *Auricula* and others show characters of *P. hirsuta*. They are free-flowering, delightfully fragrant, bold of colour, and vary in height from three inches to five inches.

A rich, sandy loam and good drainage are essentials to the successful cultivation of this Primula, and water should be used sparingly during the winter.

A few of the best of these hybrids are *P. pubescens alba* (syn. *P. nivalis*), rather a rare plant; *Mrs. J. H. Wilson*, lilac-purple; *The General*, terra-cotta; *The Professor*, rich claret, and *Ruby*, ruby-red. *S. D. R.*

## HARDY FLOWER BORDER.

### INULA HELENIUM.

BOLD and effective plants are frequently needed for the back of large borders or the wild garden, and they are specially desired for furnishing a display in the later months of summer. *Inula Helenium* is a bold flower of this description.

Like most tall plants, it requires good soil if full satisfaction is to be derived from its boldness; grown in ordinary garden soil, its general stature is about six feet or a little more, but if given good, fertile loam, well enriched with manure and not too dry, it will attain a height of eight feet. At this stature it is a most imposing plant, after it has had a year or two to develop.

The plant has large, massive, imposing leaves, and large heads of yellow flowers, which generally begin opening in July and continue into September.

For propagating purposes large plants may be divided, but a stock may be raised from seeds. Planting may be done in spring. *S. Arnott.*

# CLIBRANS' SCHIZANTHUS

*The World's Best Strain*

AWARD OF MERIT, R.H.S.

The finest strain of Schizanthus in existence to-day. The plants form bushes about 3 ft. in height, and produce an abundance of large richly coloured magnificently blotched flowers embracing a wide range of colours. For Conservatory and Greenhouse effect in Spring they make a gorgeous display. Apart from the beauty of the plants with their light elegant foliage, the flowers are very charming when cut, and last well when placed in water.

Choicest mixed, pkt., 2/6 and 5/-, post free for cash.

## JOSEPH FISON & CO IPSWICH

Fertilizer Manufacturers to H.M. the King.

I saw a house containing 20,000 plants just before Christmas at the establishment of Mr. James Wheeler, Natick, Mass., which were a wonderful sight; the flowers were large and carried on long, strong stems. Ten thousand flowers were available for the holiday trade, and the wholesale price was far ahead of all other varieties, being \$25.00 per 100. Incidentally, I might state that Mr. Wheeler spent three months in England last summer, and sails again in May for another trip; he is a native of Wiltshire.

There are several new sports from Matchless which, I think, does not do very well in England. One is variegated resembling the old Prosperity, another named Gloria, originating with Mr. Wheeler, is rose-pink in colour. Radiolite, a western variety, is brilliant red, and seems likely to win favour. In the rose-pink section Mrs. C. W. Ward, or an improved form of it, is still more grown than any other; it bursts the calyx rather badly, however, a defect which Betty Lou, a newer variety, is less prone to. Eldora, raised by Mr. William Sim, of Cliftondale, Mass., is practically the only variegated variety grown here to-day, having displaced Benora. Mr. Sim is introducing Jewel this season; it is similar to Pink Delight in colour and a very free bloomer, with good, wiry stems. His last season's introduction, Arctic, a pure white, very fragrant variety, appears to be doing fairly well. Matchless, Harvester, and White Delight are our leading whites; a White Ward appeared in Denver, but will not seriously compete with the other varieties named, although a truly remarkable keeper. Johnson's Crimson, from Mr. C. B. Johnson, Woburn, Mass., is the best crimson we have, Donald coming next. Mr. Johnson, in Ivory, has one of our coming whites, also other very fine seedlings.

Carnations here are not so popular as in Great Britain; they sold poorly as compared with other flowers at Christmas. Growers are prone to keep them too long on the plants and market them too late; in addition, tied up in round bunches of twenty-five each, crowded tightly into large wooden or corrugated boxes, and mauled over by salesmen on the flower stands they get badly bruised, and it is little wonder that they "go to sleep" quickly in our steam-heated American homes. W. N. Craig.

## NOTES ON JAPANESE AZALEAS.

In Upper Burma and the Tibetan frontiers of China are the central home of the true *Rhododendrons*, Japan may fairly claim to be the stronghold of the Azaleas. Up and down the country, in their season they splash the landscape with vivid colour, be it orange, red, white, pink or purple. Not that Nature mixes all these colours indiscriminately.

In the half-shade of the forests surrounding the chain of lakes lying along the northern foot of Fujiyama, the lovely mauve-flowered *Rhododendron reticulatum* (*R. rhombicum*, of Bean) is alone in its glory. Travelling a few miles westward over the Motosu Pass, after leaving behind the cindery lava soil of the great volcano, one finds the sunnyslopes ablaze with the fiery-salmon or tawny-red of *R. japonicum*. On the same banks there is also found a small Crab Apple, covered in May with snow-white blossom, while sprawling over rock and shrub, wild *Wistarias* flaunt their lilac-blue flowers, the whole producing a wonderful chromatic effect.

In the southern island of Kyushu, Azaleas are even more abundant, and range from sea-level up to several thousand feet. Although of many colours and of somewhat diversified appearance, Mr. E. H. Wilson, in his *Monograph of the Azaleas*, has grouped many of these together under the one specific name, *obtusum*. I have not critically examined these plants so offer no opinion on this classification. It is certain, however, that the colours of the flowers change more or less definitely as one ascends to higher elevations. On the Unzen Mountains for instance, mauves very largely predominate in the upper zone; a little lower down vivid pinks and reds are met with, while still lower, the flowers are almost all apricot-coloured, and

no mauves at all are found. This probably explains why the magenta form, known as *amoenum*, is the hardest and best suited to our English climate. As the different colour forms overlap, and appear to intermix, on the Unzendake, a casual visitor would conclude that on this mountain there occur at least three closely allied species which apparently hybridise freely on the fringe of their respective altitudinal zones. These parents of the now well-known Kurume Azaleas are all sun-lovers, and occur on the open hillsides and in places such as one would expect to find Gorse growing at home.

If these tiny-flowered Azaleas of the mountain slopes can be likened to the equally small-

I have ever seen. Imagine a greatly glorified *R. Vaseyi* growing as a tree and with much larger and deeper pink flowers, and the reader will have some small idea of its beauty. The flowers measure about four to five centimetres in diameter, according to Wilson, and are usually solitary, starring the bush- or tree-top with wide-open, almond-pink blossoms. Viewed against a grey sky or the hazy blue of a distant mountain their beauty holds one spell-bound. As already stated, this Azalea forms small straggling trees up to about twenty-four feet, or twenty-five feet, with a trunk circumference of forty inches or more. As their neighbours — *Stuartia Pseudo-camellia* (Fig. 50), *Hamamelis arborea*, *Hydrangea petiolaris* and many more are

FIG. 50.—THE HOME OF THE YASHI AZALEA; SHOWING A FINE SPECIMEN OF *STUARTIA PSEUDO-CAMELLIA*, 30 FEET HIGH.

flowered *Rhododendrons* of the Lapponic series—for wind and sun does not seem to injure them—the large, forest-loving Azaleas of the Nikko district may certainly be compared with the Falconer series. Both *R. quinquefolium* and *R. pentaphyllum* are essentially sylvan species, and in the shelter of the woodlands form sparsely-branched trees up to twenty-five feet in height.

The spring of 1926 was a very late one in Japan, and on April 28 snow was still lying around the lake of Chuzenji, which is about 4,300 feet above sea-level. The white-blossomed *quinquefolium* had not opened its flowers before I left on May 20, but the more beautiful Yashi Azalea (*R. pentaphyllum*) was already out. This Azalea is incomparably the finest

all of proved hardiness in England it is difficult to understand how so lovely a plant is still virtually unknown in our gardens\*. It is evident that it requires the shade and the leafy soil of a deciduous wood. Given these conditions, with ample moisture and perfect drainage, I see no reason why it should not thrive with us; certainly no trouble would be too great to achieve success with such a superb plant. I was always fond of Azaleas, but since my last visit to Japan I have completely lost my heart to them. Collingwood Ingram.

\*Mr. Bean informs me that this Azalea has been introduced to Kew and Caerhays, but has disappeared from the former collection. It was formerly regarded as a pink form of *R. quinquefolium* but is undoubtedly a distinct species.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## NOMOCHARIS\*.

IN number LXXI of the *Notes* from the Edinburgh Botanic Garden, dated, June 1925, Mr. W. E. Evans published a revision of the genus *Nomocharis*, in which he enumerated a pair of new species, suggested adjustments in the nomenclature and relationship of others, and for the time left the total number of species at twelve. The arrival of further material from the explorers, Forrest and Ward, has enabled Mr. Evans to amplify and, in the main, to confirm the conclusions already arrived at, as well as to describe a new *Nomocharis*—*N. Georgei*.

Of the two new species referred to in No. LXXI of the *Notes*, a melancholy interest attaches to one—*N. basilissa*—as it was discovered by Farrer during the venture which ended so tragically in the autumn of 1920. A few months before he died, Farrer found the plant (F. 1,738) in the dwarf cane-breaks on the upper alpine region (12,000 to 13,000 feet) on the Chawchi Pass, and in a letter to Mr. Euan Cox† wrote of it as "bright fiery vermilion." On his field ticket for this *Nomocharis*, Farrer wrote that he found the bulbs so densely impacted in the roots of the cane-brakes that he did not then obtain a specimen‡; but a few weeks later, on his return to his hut at Nyitadi—"above everything and beyond Nowhere"—he found it (F. 1,800a) growing sporadically on the Mokuji Pass and secured some bulbs.

To cultivators the most interesting point about *N. basilissa* is the colour of the flowers, which moved Farrer to a characteristic word-picture§: "Something flared out of the Bamboo scrub. Could I be mad? Was it *Lilium chalcidonicum* or *L. pomponium* on the Nensan road? No: it was an unspotted *Nomocharis* with flowers of a tone unknown to me in all hardy Liliaceae, of a pure salmon-flame-colour that makes even *L. pomponium* and *Tulip La Merveille* opaque by comparison, and can only be paralleled in the most glowing notes of *Papaver orientale*. Nor is it abundant, this unique beauty; occasionally only, in very narrow limits, among the scrub and Bamboo. But with its solitary head, like Little Em'ly, "hanging a little down," "Oh, what a wonder!"

Incidentally, the head is not apparently always solitary nor hanging "a little down,"

for on his field note for this number (1,800a) Farrer wrote: "When well-developed it can attain three to four feet, and can carry as many as five or six flowers, always *absolutely pendent*,\* not horizontal."† A comparison of this field note and Farrer's description of the plant in his letter to *The Gardeners' Chronicle* affords a good example of the confusion Farrer's descriptive pen sometimes unwittingly caused to those who seek to get to the core of things. The flowers of *N. basilissa* cannot very well be hanging "a little down," and at the same time "absolutely pendent"; nor, at one and the same time, can the colour be that of *L. chalcidonicum*, *L. pomponium* and *Tulip La Merveille*, for the colour of the particular *Tulip* is quite different from that of either *Lily*; not by any stretch of the imagination can it be called a "fiery vermilion."

species has reached the flowering stage in this country. As it is in cultivation at Edinburgh that is not likely to be long.

The second of the pair of new species published in No. LXXI of the *Notes*—*N. euxantha*—is not in cultivation yet, although it was first found by Forrest eight years ago on Ka-gwr-pu in the Tsarong. He found it again in much the same area three years later, and once more, in a new station in the Mekong-Yangtse divide two years ago, on each occasion at 13,000 to 14,000 feet. The flowers are nodding and fragrant, and what is of more interest to cultivators, are deep yellow, or soft yellow, faintly marked or spotted with purple.

Happily, better luck has attended the explorer's discovery of *N. Georgei* (F. 24,772, 26,853 and 27,328), the new species now described by Mr. Evans, as flowering bulbs have been

FIG. 51.—ODONTONIA NUBIA VAR. RENOWN.

R.H.S. First-Class Certificate, Jan. 25. Flowers crimson, carmine and red. Shown by Messrs. Charlesworth and Co. (see p. 88).

No seeds of this fine thing of Farrer's reached home from him, but, happily, Forrest came upon the plant in the same area four years later, and seed (F. 25,587) received from him has since germinated at the Edinburgh Botanic Garden. Assuming that, in his enthusiasm, Farrer did not let his pen run away with him, it is evident that the colour as well as the port of the flowers varies within wide limits, because Forrest describes the flowers simply as "white, interior base heavily flushed purple-crimson"—a very different thing from the "luminous salmon-scarlet" or "fiery vermilion" of Farrer's specimens; nor, on his field ticket, does Forrest mention the "absolutely pendent" habit of the flowers as Farrer saw them. Mr. Evans, however, observes that in the dried state no difference of colour can be detected between the specimens of either collector, and so cultivators must possess their souls in patience until the

raised at Edinburgh. The petal-colour is "rich, soft blue-purple throughout, interior lightest." The nodding flowers are solitary and borne on stems six to eighteen inches high, crowded with leaves, and Mr. Forrest regards this *Nomocharis* as a very beautiful plant, unique in the colour of the flower, which rivals that of *N. saluenensis*. Those who saw the clump of this lovely plant in flower on the Edinburgh rock garden last May and June will agree with him. Except in regard to colour, Mr. Evans places this species near *N. Souliei*, the *Fritillaria Souliei* of Franchet,\* a most attractive species, with deep, black-crimson, fragrant flowers, which seems so far to have beaten cultivators, though seed and seedlings have not been lacking.

Another *Nomocharis* now in cultivation is *N. nana*, an old friend, *Lilium oxypetalum*, in the new guise bestowed on it by Mr. E. H. Wilson.†

FORSYTHIA INTERMEDIA AT THE ROYAL GARDENS, KEW.

This Himalayan species has been found again, this time by Ward on Nyima La, near Turnbates, in southern Tibet, in 1924, and like others before him, the explorer evidently found it difficult to place the plant which began its herbarium existence as a *Fritillaria*, was subsequently transferred to the *Lily* genus, and has ended up as a *Nomocharis*. When Ward found the plant it must have puzzled him, because as he wrote on the field ticket: "The bulb, dissimilar perianth lobes and flower colour suggest *Nomocharis*. But there is nothing *nomocharoid* in the habit, petaline glands or stamens. Probably a *Lilium*, not a *Fritillaria*. Note that the perianth is more or less persistent and that the stamens are slightly adherent to the base of the inner perianth segments. The glandular function seems to belong to the hairs rather than to the sinus between, hence we may have here a transition to the divided glandular area of *Nomocharis*." In fact, the species seems to be on the now, more or less imaginary, dividing line which has been drawn to separate *Nomocharis* from *Lilium*.

The cultivation of *Nomocharis* has not kept pace with the scientific consideration of the genus which was resumed in 1918 by Bayley Balfour at the point where Franchet left it twenty-eight years ago, and has since been continued at the Edinburgh Botanic Garden by his successor and Mr. Edgar Evans, with the active assistance of Mr. George Forrest who, over a long series of years, has done so much more than other explorers to place herbarium material and seeds of *Nomocharis* at the disposal of science and horticulture. The species are undoubtedly difficult to manage out of doors, but not more difficult, possibly, than other plants, which, for some time after their introduction were thought to be intractable, but have since proved manageable.

"One of the reasons for the present lack of successful cultivation (of *Nomocharis*) seems to be that gardeners treat it as a *Lily*. Now most *Lilies* grow under conditions where the bottom half of their main stem is shaded from the sun; in some cases they actually grow in half-shade; in others they poke their noses out of Bracken or low shrub. I have never heard of a *Nomocharis* growing anywhere except in an open position, sometimes in rough alpine turf, sometimes in richer meadowland; but never in a situation that can be called sheltered. There is one other main difference between the *Lily* and the *Nomocharis*: *Lilies* may grow in clumps, but this is not, apparently, a golden rule. They are often contented if their nearest neighbour is ten yards away. As far as I can gather, this is not the case with *Nomocharis*. They are true community plants, never so happy as when they are jostling their neighbours and carpeting the alpine turf. It is certain that their pull roots are strongly developed, and there is every reason to believe that some of them, at any rate, run underground; this is the case with the one we found.\* Their bulbs are extremely deep considering that the plant rarely exceeds two feet in height. On each occasion that we dug for them we found that they were at least as deep in the ground as the stem was tall. With these facts, or suppositions, to work on, it is possible to suggest certain lines of treatment. I could imagine them succeeding on a slope facing north, or preferably north-west, with good drainage, but not dry. They will require some depth of soil, certainly worked four feet down, and the soil should be a lightish loam with a fair addition of humus. As we cannot absolutely guarantee a moist summer, they might be under the lee of a clump of trees that would keep off a few hours of direct sunlight."†

It has often been said that it is waste of time for British cultivators to attempt the reproduction of natural conditions in the general cultivation of exotic plants, and when Upper Burma, Tibet and western China are in question, any

approach to the attainment of these natural conditions is clearly impossible. None the less, gardeners always like to know the conditions under which wild plants grow, and clever cultivators will draw their own deductions from Mr. Cox's shrewd observations. If, as may well be the case, a moist summer is in any way essential to the welfare of the *Nomocharis* from Upper Burma and other monsoon areas, the point should present but little difficulty, for at this time of day it is hardly likely that anyone would embark on the serious cultivation of difficult plants without adequate overhead or subterranean irrigation for use on the comparatively rare occasions when Nature fails us. It may be, however, that sunlight has a more direct bearing on the cultivation of alpine plants in general than

interesting still from the cultivator's point of view, is that self-sown seedlings began to make their appearance a year or two since, and as practitioners know, that is a sign that the battle is more than half won. The bulbs are in deep loam with good but not rapid drainage, and there is water about the plants all the year round—the bulbs are never dry: *verb. sap.*

On the leg of Wigtonshire, which—with its toes in the Mull of Galloway—separates the Bay of Luce from the North Channel, Logan probably comes nearer to Eden than other places in Britain, but, none the less, it is possible that the cultural conditions, of which the place can hardly have a monopoly in England or Scotland, have more to do with the satisfactory growth of this *Nomocharis* at Logan than the moist, benign climate.

FIG. 52.—*ALOE CILIARIS*

R.H.S. Award of Merit, Jan. 25. Flowers bright coral red. Shown by Cecil Hanbury, Esq., La Mortola. (see p. 89).

is at present realised, and should that be so it would seem to be a point past the power of man to alter.

The fact that *Nomocharis* has, so far, baffled many clever cultivators need not deter them and others from the pursuit of a solution of a problem hardly likely to be insoluble; rather should it act as a stimulant to further endeavour. And though it is improbable that all the available species will respond to identical conditions, the success already achieved with *N. pardanthina* by Mr. Kenneth McDouall in the garden at Logan, is of good augury, and may prove a finger-post for others.

Five years have passed since Mr. McDouall began the cultivation of this species from seeds collected by Farrer in 1919, and he reports that the plants have flowered and fruited annually since 1923, the capsules usually ripening in September. Last summer one plant bore eleven flowers and another ten. More in-

Of species other than *N. pardanthina*, which has not yet shown any particular liking for the place, the headquarters are at the Royal Botanic Garden, Edinburgh, where, however, neither the general conditions nor the climate are such as to suggest the possession of any especial virtue for *Nomocharis*. Such satisfactory results as have been achieved there in the cultivation of the genus are probably due more to the cultural skill for which the Garden is justly famed than to other factors. The difficulty with *Nomocharis* is in the initial stages; seeds usually germinate readily enough and the resulting crop of seedlings is regulated more by the quantity of seed than by anything else. In one way and another, many thousands of *Nomocharis* seedlings must have been raised in this country since the pioneer of the genus here first bloomed at Edinburgh, but the practical result has been infinitesimal. It is in the second and third year that

\*Mr. George Forrest informs the writer that his old type of *Nomocharis* of the Tall Range, which has changed its name from *N. pardanthina* to *N. Mairei*, often throws out stoloniferous, bulb-bearing growths from the base of the bulb, and the same character has been noticed in cultivated plants of this *Nomocharis*. Mr. Forrest has not noticed the same character on any of the many other species of the genus he has collected. A. G.

†E. H. M. Cox in *Farrer's Last Journey*, p. 89 (1926).

difficulties arise in the outdoor cultivation of these things, and these difficulties are not lessened in the case of older plants grown in pots and turned out into the garden. On the other hand, cultivation in pots, in a frame or cold house, presents no particular difficulty.

Like the tubers of certain species of *Erythronium*, the bulbs of some *Nomocharis* have a curious way of diving to the base of the pan or pot. This character, familiar enough to practitioners, is commonly advanced as a reason for deep planting. Practice has shown, however, that in our country dire failure follows any copying of Nature's ways in this respect. Bulbs of *Lilium polyphyllum*, for instance, are commonly found from eight to twelve inches deep, in humus, but no one in his senses would place them at that depth in this country. The corms of some of the Transvaal *Liliaceae* grow naturally at a considerable depth but flourish here three inches below the crust! Other instances of the same thing will occur to gardeners. *A. Grove.*

## PLANTS NEW OR NOTEWORTHY.

### GLOBULARIA MAJORICENSIS.

I HAD the very good fortune, when collecting plants in Majorca, last April, to secure one species which not only promises to be an attractive garden plant but is, I believe, quite new to cultivation. This was *Globularia majoricensis*, a species or sub-species, peculiar to Majorca, and even there of very local occurrence.

I only heard of this interesting plant at the very end of my stay on the island, on the day, in fact, on which I returned to Palma, after exploring inland, intending to sail on the morrow. At this eleventh hour I received a letter from one who has made a study of the flora of Majorca, telling me that on no account must I fail to visit *Globularia majoricensis*. It grew on a pinnacle of rock along the north coast, in the neighbourhood of Soller. The description of this rare plant was so tempting that I gladly postponed my departure and took train to the delightful little town of Soller, which is one of the show places of the island. It lies in the hollow of the mountains, a mile or two back from the sea. I have seldom visited so attractive a little town, and enjoyed there the sort of weather that the best English Junes give, with all the accompanying English June flowers—and many sub-tropical ones thrown in. I arrived in late afternoon, and immediately set out to look for the *Globularia*, but this first attempt was a failure and fizzled out in a valley of vines, Olives, Oranges in full blossom, and nightingales in full song, through which I groped my way home in the scented dusk. The next day I walked right out to the harbour of Soller and then along the north coast by a narrow path, which followed the precipitous coast line.

After several miles, I came in view of a most astonishing pinnacle of rock which left me in no doubt that I had found the home of the *Globularia*. This pinnacle rose sheer and stark like a church steeple, hundreds of feet high, one of the most dramatic rock formations I have ever seen. The base of it, which rose immediately from the path, was a very steep slope of loose stone, rock outcrops, and scrub, up which I scrambled to the roots of the pinnacle itself, and there, high up on the perpendicular cliff, I could see enormous plants of *Globularia majoricensis*, huge, ancient specimens, utterly impossible to approach and quite impossible to collect if one could have reached them. *G. majoricensis* forms large rosettes of deep green, glossy, spoon-shaped leaves, twelve to eighteen inches across. The plant has a woody base, which, in old specimens, branches and carries a dozen or so rosettes in the form of a large cushion. Some of the specimens seen must have been four feet or more across and, judging by their woody trunks, of immense age. After much creeping and crawling about the base of the pinnacle, I came upon one or two colonies of younger plants, evidently

seeded down from above, growing in the scree-like ground. These I collected and packed in moss with infinite care, but I must confess I felt very doubtful of their surviving. The roots looked so hard and wiry, and carried so little fibre. However, much to my joy and surprise, they established themselves extraordinarily well, and have since shown every sign of enjoying captivity.

Although I was not there at the proper flowering season, I found one or two heads of blossom remaining. These were typical of *Globularia* in their rather fluffy, Scabious-like aspect; each flower-head was close upon an inch in diameter, carried on a nine- to twelve-inch stem and was of a fine lavender-blue colour.

As to the plant's hardiness, I have had it planted out in the open at Stevenage, and, so far, it has shown no signs of distress from the snaps of frost we have had this winter.

*Globularia majoricensis* promises to be a first-rate plant for vertical positions in the rock garden or for the wall gardens. Although growing on the north side of the rocks in Majorca, I am giving it the fullest sun possible here.

It is likely, I think, to remain a rare plant in cultivation. It might be possible to strike cuttings, or rosettes, but it is evidently a slow grower and will not produce these in any abundance, and it remains yet to be seen whether it will produce fertile seeds in this country. *Clarence Elliott, Stevenage.*

## THE PROMISCUOUS PRODUCTION OF NEW DAFFODILS.

DURING the course of the next few weeks there will be published by the R.H.S. a new official classified list of Daffodils and Narcissi. The previous list published three years ago contained the names of some 3,500 varieties, and it is safe to predict that in the new list there will be added to these some hundreds more. Whither are we directing our course? Is it remotely possible that there exist to-day four or five thousand varieties of sufficient merit to warrant separate names? I doubt it. The most comprehensive trade list in my possession embraces about one-tenth of this number, and it may be fairly assumed that these are representative of the best available selection of all classes.

I think it would be an excellent idea if the R.H.S. could grant, quite apart from all awards of merit, a certificate of novelty! This might prove one way for a harassed, would-be collector to distinguish between a hundred catalogue superlatives. Who among us has not suffered from the purchase of highly-priced, so-called novelties at the seller's valuation? Let us suppose that two separate raisers had the good luck to produce similar flowers of apparently identically high quality. They might both be justly entitled to Awards of Merit wherever shown, but the first of its class shown at an R.H.S. meeting would, in addition, gain a Certificate of Novelty. Let us take as an illustration of this Croesus, produced by Mr. J. C. Williams, and Owen, raised by Mr. Watts. Not one person in five hundred could distinguish between these flowers in a mixed bunch. The only distinguishing feature to my eye is that the stem of Croesus is always lightly fluted, whereas in Owen it is smooth.

It is no more than natural that every raiser who has spent the several, or even many necessary years in producing new flowers should regard some of his geese as swans, but it is equally true that if three plants among a thousand seedlings show merit beyond that of existing known varieties, as apart from the merit of the parent stocks, he would have every reason to congratulate himself.

Each year provides a fresh sensation in size or colour or grace of form. With such achievements before our eyes it is sheer waste of time to expect to get even abreast of the times by hybridising and saving seed from the vast majority of commercial varieties. One or two exceptions may, perhaps, be made in the case of such flowers as Princess Mary, which has

proved so prolific of novelties, *N. cyclamineus*, and possibly also of *N. triandrus calathinus*. This latter yields progeny of such an immensely superior stamina and form than *N. t. albus* that I can find no place for the latter, and I am surprised to find it so frequently cropping up in pedigrees.

There is undoubtedly a future for selected first and second hybrids of *N. triandrus* and *N. cyclamineus* as rock plants, where their graceful charms are seen at their best, but for every flower of merit there are a score of characterless weaklings which could not be singled out by their raisers if grown among others of the same class.

I do not think there can be any question of limiting the range or direction of progress in which improved forms are to be looked for. Some of the latest forms, such as Beersheba, Red Sea, Therapia, Seraglio, etc., will find their own niche in the hall of fame, ousting in due course their more modest forebears, but as one by one these flowers of new form and beauty arrive, why should it not be possible to set upon them an official seal of progress which could not be obtained by later and similar introductions, however meritorious they might be? The possession of such a certificate would indicate to a purchaser "This flower opened a fresh avenue of progress." Its absence would not in any way detract from the later awards to its successors; on the contrary, it would indicate that such award was gained in face of the known merit of existing flowers, but the absence of a certificate of novelty would indicate that other very similar flowers were already in existence!

Let this be illustrated by citing the case of White Lady, which has held its well-deserved place in our affections for (I believe) thirty-two years. It would be no whit the less popular if a Certificate of Novelty were to be accorded to Osprey, yet a catalogue description of both might easily lead the uninitiated to imagine they were identical. At present, I think Osprey stands alone, but without doubt other more or less similar seedlings will be raised, and with them the usual accompaniment of praise. Let them stand on their merits, but let Osprey and Mr. P. D. Williams have the credit for "getting there" first!

The promiscuous naming of characterless and "too-much-alike" Daffodils is much to be deprecated from every point of view—as well might bedding Pansy seedlings be named! No two are entirely identical in height and form and date of flowering, but the general public has no room for such hair-splitting, and no interest in more than a tenth of their number. If the present practice of extravagant and superlative catalogue descriptions of mediocre "novelties" be maintained, the inevitable result must be a sharp and speedy decline in the popularity of the flower, as disappointment follows disappointment. *Herbert G. Longford, Abingdon.*

## NOTICES OF BOOKS.

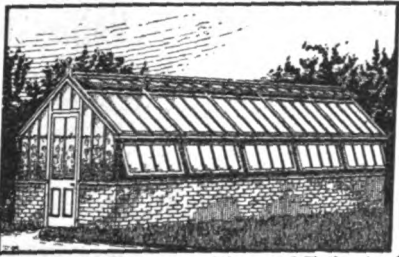

### Dahlias for the Garden.

THE fifth volume in the *Gartenschonheit* series of books is on the subject of the Dahlia,\* and displays all the physical features—superb illustrations, clear, bright type, art paper—which we have learnt to look for in the volumes which are issued from Akazien-Allée. In matter, also, it is in no way lacking, containing a very interesting history of the Dahlia, from the time of Hernandez's first observation of the flower in Mexico in the sixteenth century up to the present day, and comprising a number of illustrations showing the gradual development of the flower as we now know it. One of these illustrations, by the way—the Paragon type of single Dahlia, drawn by the late W. G. Smith—originally appeared in *The Gardeners' Chronicle*. A double page is occupied by a very useful collection of photographs showing the various types now known, twenty-one in all, in proportionate size—a means of ready refer-

Trade Mark.

ence which will prove of value to all fanciers of the flower; and growers and gardeners alike will welcome the lists at the end of the book in which the varieties are grouped according to colour, size, and various other characters.

The coloured plates which occur at intervals help to brighten the volume, though it is in no particular need of extra attraction. The chief fault to be found with it is its awkward shape, almost square, and about ten inches in height. This, however, is evidently due to the exigencies of the really excellent photographs, which could not have been reduced in size without detracting from their merits, or reduced in number except at the expense of the volume as a whole. The instructions on cultivation and propagation are excellent, and are illustrated by clear diagrams; pests and diseases are adequately dealt with, and a good index completes a thoroughly attractive brochure.

#### Forcing by Hydro-cyanic Acid.

THIS booklet\* describes some interesting experiments which have recently been carried out by Professor Dr. Gassner and Herrn W. Heuer, of the Brunswick (Germany) Botanic Garden, which serve to show that hydrocyanic acid gas, besides being a valuable insecticide,

is fully described with numerous very clear diagrams, and a set of photographs of plants, as treated with the gas and not so treated, showing the difference in the condition of development. The plants illustrated are Lilac, Forsythia, Prunus Avium, Deutzia gracilis and D. crenata, Lily-of-the-Valley, and Iris pumila, but probably further experiments would disclose other plants which would respond satisfactorily to the method. The authors claim for the method that it is cheap, as well as effective. It is not clear whether in making this statement they are taking into account the initial outlay of the apparatus, but it would appear that, apart from the cheapness of the actual chemicals employed, it is economical, as fewer plants are lost in the forcing process than when the older methods are utilised.

Experiments of this kind are always costly, and can seldom be undertaken by practical growers owing to the risk of loss. If the claims made by the experimenters in the present instance are borne out by experience, those growers who are able to profit by their researches will feel considerable gratitude to them for the very detailed and careful way in which they have undertaken their task, and the clear and comprehensive manner in which they have made known the results and pointed the way for others to follow.

#### DEVELOPMENTS AT WISLEY.

As an everyday gardener with an eye to the practical in our craft, but with fewer opportunities than I would like of visiting the gardens at Wisley, recollections of an autumn visit, when I recorded some of my impressions of practical developments for the benefit of readers of *The Gardeners' Chronicle*, prompted me to make a special effort to again pay a visit to these gardens to keep in touch with the developments then so apparent.

Fortune favoured me on a sunny day in mid-January and, knowing how intensely interesting the Heath collection in the Seven Acres is at this season, my steps took me in this direction. On entering the path at the corner of the Azalea garden which leads to the Seven Acres, I realised that considerable changes had taken place here. The border between this path and the Azalea garden formerly consisted of a line of *Rosa rugosa*, rough grass and bulbs, with an old tool-shed at the far end, partly hidden by clumps of Bamboos. The removal of the Roses and moving of the Bamboos to form a background to the borders between it and the Azalea garden has resulted in a fine, spacious border, one hundred yards long, and varying in

FIG. 53.—GROUP OF PRIMULAS EXHIBITED BY MESSRS. JAS. CARTER AND CO. AT WESTMINSTER ON JANUARY 25.

(see p. 89).

has also a definite effect in forcing certain plants into bloom before their normal flowering period. It has the advantage of taking much less time than the methods usually employed, for the plants require to be "gassed" for only a couple of hours, whereas etherisation takes normally from one to two days, and the hot water treatment from half-a-day to a day. This means that with one and the same apparatus, several batches of plants can be treated one after another on the same day. Another advantage is that the gassing can take place in any temperature; indeed, the method seems to possess so many points in its favour that almost the only thing which can be urged against it is the extremely poisonous nature of the fumes. However, if the apparatus, or forcing-chamber, is placed out-of-doors, and the plants run into it from outside on a little wheeled truck, as shown in the diagrams illustrating the text, the danger is practically non-existent. The operation cannot, of course, be done in the open, owing to the very volatile character of the gas.

The construction of the gassing-chamber

#### A Foresters' Diary.

ONE of the most interesting of the many diaries issued in the early days of each year is the one compiled for the special use of foresters\* and all concerned in the management of forests, woodlands and estates. Although it contains a vast amount of useful information concerning legal matters, maintenance charges, costs and sizes of transplants, planting tables, taxation, insects and fungi that attack forest trees, and timber tables and measures, it is of handy pocket size and still provides ample room for the entering of engagements and personal cash accounts.

An item of great value in the diary is the list of names and addresses of foresters and assistant foresters in Great Britain and Ireland. This extremely useful diary is gilt-edged and so sumptuously bound in scarlet covers that one is proud to use it and gardeners as well as foresters will be interested in the information it contains.

Both Mr. A. D. C. Le Sueur, who is responsible for the information given, and Messrs. E. Benn, Ltd., the publishers, have done their work admirably.

\*Webster's Foresters' Diary and Pocket Book, 1927. Ernest Benn, Ltd., 154, Fleet Street, E.C.4. Price, 3s. 9d. nett.

width from twenty feet at one end to thirty feet at the other. This extensive border is cut by two grass cross-paths leading into the Azalea garden. This presents an expansive site for herbaceous plants, where ample room is available for showing the characteristics of the larger-growing varieties and bordering, as it does, a main path leading to important collections of shrubs, gives it an ideal position.

The Heath collection, well worth a visit at any period of the year, is particularly attractive at this season, and *Erica carnea* King George and *E. c. praecox rubra* were making a very fine display, while *E. c. Queen Mary* and *darleyensis* were also very good.

A noticeable improvement in this quarter is the sowing of the paths surrounding the collections of shrubs and Lily pond with the finer grasses. A good sward is already evident, in some places down to the water's edge, and the amenities of this part of the garden are considerably enhanced.

At the extreme end of the shrub collections alterations of an important character have been effected, and a corner of intense interest created. The stream and banks dividing this garden from the Pinetum, which was overgrown with Bramble and Hazel, have been developed as a hardy Fernery, and the lower positions of the banks are already planted with many species

This extremely useful diary is gilt-edged and so sumptuously bound in scarlet covers that one is proud to use it and gardeners as well as foresters will be interested in the information it contains.

Both Mr. A. D. C. Le Sueur, who is responsible for the information given, and Messrs. E. Benn, Ltd., the publishers, have done their work admirably.

\**Webster's Foresters' Diary and Pocket Book, 1927.* Ernest Benn, Ltd., 154, Fleet Street, E.C.4. Price, 3s. 6d. nett.

width from twenty feet at one end to thirty feet at the other. This extensive border is cut by two grass cross-paths leading into the Azalea garden. This presents an expansive site for herbaceous plants, where ample room is available for showing the characteristics of the larger-growing varieties and bordering, as it does, a main path leading to important collections of shrubs, gives it an ideal position.

The Heath collection, well worth a visit at any period of the year, is particularly attractive at this season, and *Erica carnea* King George and *E. c. praecox rubra* were making a very fine display, while *E. c. Queen Mary* and *darleyensis* were also very good.

A noticeable improvement in this quarter is the sowing of the paths surrounding the collections of shrubs and Lily pond with the finer grasses. A good sward is already evident, in some places down to the water's edge, and the amenities of this part of the garden are considerably enhanced.

At the extreme end of the shrub collections alterations of an important character have been effected, and a corner of intense interest created. The stream and banks dividing this garden from the Pinetum, which was overgrown with Bramble and Hazel, have been developed as a hardy Fernery, and the lower positions of the banks are already planted with many species

and varieties. Good paths intersect the collection, giving visitors easy access to the plants and a new Oak bridge has been erected at a higher level to carry the right of way footpath over the stream, with the result that one gets an uninterrupted view to the river Wey, in which direction a continuation of these developments offers great attraction.

As one looked at this large area of flat meadow land alongside the stream, framed with a beautiful woodland belt beyond, one could not help feeling what an ideal home for many of our more recently introduced Primulas it would make. I had previously walked over the higher ground here and thought it was totally undeveloped, but on seeing considerable openings had been made, I followed the path in the direction of the stream for some distance and was surprised to find many specimens of Conifers exposed which had been completely overgrown with Bramble, Broom and Bracken.

A grass path has evidently been recently levelled, and the possibilities of further developments in this area are great. The path leads in the direction of the old fruit plantation, commercial fruit trials and Rose trials, and if future developments here connect these parts of the garden by an interesting path it will be much appreciated by visitors who now look on the public road as the necessary means of connection. Returning to the older part of the garden, I passed by the Nymphaea pond, and here also considerable alterations had been effected. The path which previously divided the pond into two parts has been entirely removed, the paths leading to the water-edge rearranged, and the pond looks bigger and more imposing.

Proceeding to the rock garden, I found that a good deal more remodelling had been done, resulting in showing up the stone to better effect and also enabling the planting of a considerable increased number of rock plants. A charming colony of *Primula Winteri* of outstanding merit was noticed.

The new alpine houses, which at the time of my last visit, was in the hands of the builders, is now completed and well-furnished with plants of remarkably healthy appearance, many of which are beginning their floral display. Prominent amongst these was an exceptionally fine pot of *Soldanella montana*, and good plants of *Saxifraga Burseriana tridentata*. Other plants in flower were *Saxifraga Ada*, *S. Kellereri*, *S. Irvingii*, *S. Rocheliana*, *S. Sparkling*, *S. Riverslea*, *Primula Juliana*, *P. "purple splendens"*, a fine purple hybrid; *P. Crispii* × hybrid, and *P. megaseaeifolia*. The house strikes one as an eminently practical one for its purpose, admitting the maximum amount of light in the short days and providing for that essential need of alpine—perfect ventilation—in a very practical way.

Many alterations are taking place in the old vegetable trial grounds near the main entrance, and this quarter is now divided into seven divisions by Hornbeam hedges. The collections of *Aquilegias* and German *Irises* are on portions of this ground, and it is obvious that flowering plants are to be grown on the whole of this area. Abutting, as it does, on the newly-planted Rose garden, which was such a success last summer, it appeals to one as a practical move for the purpose of bringing flowering plants together for the convenience of visitors who wish to study them. *Onlooker*.

## APIARY NOTES.

My last notes (November 27, p. 433) may be summarised by stating that, whilst the mating of virgin queens is still a question of chance, the mating of the mother-queen is now controllable—so far as the virgin queen is concerned. I shall interpret that apparently cryptic remark as I proceed, but before doing so it may be stated that according to the November issue of the *American Bee Journal*, Mr. Lloyd R. Watson claims that he has removed the last hindrance to controlled breeding of queens by removing even the uncertainty of the virgin's mating. By artificial insemination he claims to have succeeded in fertilising virgins.

If this claim be substantiated then, by the work

of Mr. Gilbert Barratt and Mr. Watson, every hindrance to "line" breeding in queen bees has been removed.

But to return to Mr. Barrett's part of the matter. Every observant bee-keeper knows that the eggs in a hive may be of two kinds. Usually the queen lays eggs in worker cells and worker bees are produced therefrom. But about May she begins to lay eggs in drone cells, and drones result. Also an unfertile virgin can lay eggs which will produce drones. Still further, worker bees can lay eggs, and these again are always drone eggs. But a fertile queen lays eggs that produce drones, and eggs that produce worker bees. Neither an unfertile virgin nor an ordinary worker can lay the eggs that produce worker bees.

It is the worker egg, then, that has come in contact with the spermatozoa of the male during its passage through the oviduct of the queen, and it is the worker egg that is fertilised by the male sperm. If it were not so, the unmated virgin or the laying worker could also produce worker brood.

Dzierzon, the great German apiculturist and scientist, in the face of this fact, propounded his famous theory that a fertile queen could lay male or female eggs—drone or worker—at will; that fertilisation consisted in the addition to the drone egg of the male spermatozoa, and that in the case of all drones there was no male parentage at all:—in other words, that the laying of drone eggs was a clear case of parthenogenesis.

As might be expected such a theory aroused great interest and much criticism. It is years since Dzierzon died, and, until Mr. Barratt published his experiments, the dispute continued. It was from a purely scientific interest in the matter that Mr. Barratt set himself to prove or disprove Dzierzon's theory. Mr. Barratt was then a professional man in Sheffield and had no thought of commencing as a professional queen breeder. I will allow him to relate the facts for himself.

"Freshly-laid drone eggs were secured. The comb containing these eggs was cut down and drones were squeezed on to a warm glass plate. The squeezing of the drone demands some practice before the spermatophore can be ejected. . . . The next operation was to touch the large end of the eggs with a camel-hair pencil previously dipped in the male sperm from the glass plate. The eggs were next placed in an incubating chamber, maintained at 97° Fahr. The transfer to artificial queen cells in the manner familiar to all modern queen brooders was then effected, these being given to a queenless and broodless stock of bees. They were duly accepted, capped over, and resulted in perfect queens, proving that the male spermatozoon had entered the micropylar aperture of the egg and produced fertilisation."

Here, then, is the solution of the hitherto insuperable problem of breeding better queens. Once allow that the virgin herself has the right blood on the mother's side (always possible) and the right blood on the father's side (never possible before Mr. Barratt's investigation), and the bee-keeper has only one uncertain factor to fight against, viz., the mating of the virgin. If this further claim from America can be substantiated, and artificial insemination is practical and practicable, then the breeding of queens becomes an exact science. Who shall say what progress may not follow? Already Mr. Barratt has given us fifty per cent. more ability to choose what our queens shall be, fifty per cent. greater chance of progress, and Mr. Watson may be about to confer on us the rest. We are eagerly waiting. The account of how artificial insemination is accomplished is being now submitted to Cornell University as a thesis for the Doctorate of Science, and we are promised by the Editor of the *American Bee Journal* the text of that thesis immediately the Senate have accepted it for the degree.

Meanwhile let us not forget that in the smoky environment of an English city, and by the pains and skill of an Englishman, the vindication of Dzierzon was accomplished. Mr. Gilbert Barratt proved himself the greatest queen breeder of the day in that he proved himself able to obtain queens that had not only a known female parent but a known male parent. The

mating of the mother queen was made controllable as far as the virgin queen was concerned. Yet of all those who breed and sell queens how many avail themselves of this power? No wonder that Mr. Barratt has won for his queens such celebrity, and made such advance in those qualities desirable in a really good queen. *John Maris*.

## THE UTILITY OF POT VINES.

THE value of Grape vines, when grown in pots, consists chiefly in their capabilities for supplying ripe bunches long before it would be possible to obtain them from permanent vines without unduly taxing them. They are not without value for decorative purposes, however, for when well-grown and suitably trained they make attractive objects for standing on tables or side-boards at receptions or banquets.

The propagation of vines for this purpose is best effected by raising them from eyes, but it is not wise to insert them too early in the year. Late February or the beginning of March is early enough to commence. When inserted earlier they have to be subjected to strong artificial heat at a time when light is deficient, and the canes are consequently weak and long-jointed at the base, whereas, if insertion is deferred till this time the canes make vigorous growth from the first. Do not use an excessive amount of bottom heat, but maintain a genial temperature that will be conducive to sturdy growth and to the production of fibrous roots with which it is so desirable to fill the pots at all stages. The importance of keeping the plants near the roof-glass from the time they have made a foot of growth cannot well be overstated, and so soon as they are large enough they should be placed in a position fully exposed to the light where they may be trained to the roof trellis as growth proceeds. Where it is necessary to place them between permanent or other vines, care should be taken to prevent them being overshadowed with foliage.

The proper time for repotting the plants naturally depends on the progress they make, and the only advice that can be given on this point is to suggest their being shifted at each stage so soon as the pots are filled with roots, but before they become really potbound. Generally, three shifts will be required, the first into five-inch, the second into eight- or nine-inch and the final into ten- or twelve-inch pots. A proportion of the vines will not, perhaps, make sufficient progress to require potting into the largest-sized receptacles, but as they will be valuable for growing on a second year for forcing the year following, they should receive the same attention as the others.

During the season of free growth a brisk temperature and an abundance of atmospheric moisture are necessary. The house should be closed as early as is consistent with safety and all parts of it should be thoroughly syringed. When the canes have made six feet or so of growth, they may be stopped to encourage the development of lateral shoots which should, in their turn, be stopped at the first leaf so fast as they appear. Growth should be completed early in August, and the plants having been gradually accustomed to colder conditions, may be placed outside against a south wall to ensure the wood being thoroughly ripened. The soil should be kept only sufficiently moist to preserve plumpness, and if very heavy rains occur some protection should be given to the pots. The vines should be pruned in October.

For starting in November, vines which were cut back the previous winter, repotted and started early in the spring, are best, for with good management the growth will be completed in July, and they will then have sufficient time for a thorough rest before it becomes necessary to start them again. For starting after Christmas, vines which were raised from eyes the previous spring, and have made strong growth, will be suitable.

For forcing pot-vines, low pits, adequately equipped with hot-water pipes, are best, so that plenty of heat and moisture may be readily

maintained. The canes should be bent round to a point below the rims of the pots to facilitate uniform breaking of the buds. The vines should be subjected to moderate heat only in the early stages, but every advantage should be taken of sunshine to allow the temperature to rise in the day, and syringing should be done on frequent occasions. When well-started, the vines may be retied to the trellis, and so soon as it can be seen which shoots are showing the best bunches, they should be disbudded, stopping those retained at the first leaf beyond the bunch, and subsequently all lateral growths at the first leaf.

The number of bunches which it is advisable to leave on each plant depends on the strength of the cane, but generally from six to eight bunches are sufficient, and it is not wise to exceed this number.

While the vines are in flower the air should be kept somewhat drier than hitherto and fertilisation assisted by gently tapping the canes or drawing a soft brush or piece of fur over the flowers, and so soon as the fruit is set thin the bunches immediately.

The berries will swell rapidly, but care must be taken not to force the vines too hard during the stoning period. By this time they will require an abundance of moisture and rich food and, besides applying top-dressings of solid manure, liquid manure should also be given the roots until the berries begin to colour.

The compost used should be a rich one at every potting, consisting of the very best fibrous loam obtainable mixed with a little well-rotted manure, a little finely-broken charcoal, and an eight-inch potful of bone-meal to every barrow-load of compost. For the final potting a few quarter-inch bones may be scattered over the crows. The potting should be done in the house where the vines are to be grown, taking the compost into it a few days previously to acquire the temperature of the house before use to avoid any possible check which, at any stage of growth is inimical to good results. *W. Auton.*

## VEGETABLE GARDEN.

### SEED POTATOS.

THE selection of Potato tubers for use as sets is an important one, and one which each year seems to become more important. It is now generally recognised that the factor which has most influence on the yield of any given variety is, whether or no the stock is free from disease. Of the many diseases affecting the Potato, none is more deceptive than the one known as leaf-curl. It is because of this disease that the selection of tubers for seed purposes is so important, and it is unfortunate that there is not a good sign to help us in our selection of tubers from a sample of which we do not know the history.

The greatest aid in selection is a knowledge of how the stock behaved the previous season. It does not follow that because a stock cropped well in 1926 it will do the same if planted in 1927. Gardeners have to satisfy themselves that their stock is free from leaf-curl, and this can only be done by careful examination of the haulm during the actual growing season. The question of saving one's own seed or buying sets, is not one that can be left until lifting time, because if leaf-curl had attacked the crop late in the season, there would be little indication of the attack in the crop; for the crop was there before the leaf-curl.

The setting up of seed tubers in boxes and sprouting them is a very great help in selecting healthy tubers, but one should remember that it is only a rough and ready way of selection and at the best can only show the presence of tubers which are carrying a heavy load of infection; so heavy, that the tubers fail to sprout at all or only do so weakly. When the seed tubers have been boxed, it is important that those which are only pushing weak shoots should be removed and destroyed as early as possible. If this is not done and aphides are present on the sprouting tubers, leaf-curl

will spread throughout the whole sample before the Potatos are planted.

Until quite recently there was one item of gardening operations which I felt absolutely sure about, and that item was the boxing of seed Potatos. In the past, I have had no doubt that the advantages of boxing the sets were many. I do not feel so positive about it now, and I am inclined to think that under certain conditions boxing the sets and exposing them to the light is not so good as I thought. I have a certain amount of evidence which goes to show that when the stock of seed is healthy, it reduces the crop to sprout the tubers in light before planting. It makes an interesting experiment to obtain two equal numbers of tubers drawn from a healthy strain of new Scotch seeds to sprout one lot in light in the usual way and to sprout the second in darkness; covering them with moist soil is a good way of doing it. I have found that the tubers in light are not always superior, in fact, they lose so often that I shall now plant new seed without boxing it, unless I desire to forward the crop, in which case I should box the sets and cover them with moist soil, leave them to sprout, and then plant them in the usual way. When treating the sets in this way great care has to be used when planting because the growths are more brittle than those exposed to full light, but if unbroken the brittle shoots crop best. I shall of course continue to box home-saved tubers because it is such a valuable aid in the detection of diseased and weakly tubers.

The question of a good stock of any particular variety of Potato is of great importance and is not always taken into sufficient consideration, and it is in this connection that I am inclined to disagree with the findings of certain people who run Potato trials. Plots are laid down and planted with a certain number of varieties of Potatos. The plots get the same treatment, cultivation, organic and inorganic manures; at lifting time the crop is lifted and weighed, and the results sent out. The result will probably read something like this: No. I, King Edward, yield 7 tons per acre; No. II, Arran Chief, yield 8 tons per acre; No. III, Great Scot, 9 tons per acre. The results are often meant to read as meaning that under the conditions obtaining in that experiment, Great Scot is the best variety to grow for that particular district. I find that if instead of using three different varieties I use three different stocks of the same variety I get much the same set of figures, which appears to me to point to a valuable lesson, i.e., good stocks of any variety give good crops. Bad stocks of any variety means reduced crops.

If more attention was paid by growers to the question of obtaining a good, healthy stock of seed tubers, and then to keeping the stock healthy, better all-round results would be obtained. *Somerset.*

### FAILURE WITH CELERY.

I HAVE read with interest the correspondence on Celery disease (see pp. 17, 55), and it may be of interest to your readers to know how I combat this disease and the method employed.

We grow about one thousand plants in single trenches for the convenience of spraying. One half of our plants are red, the other white, A.1. and Exhibition, respectively. The worst year for disease here was 1925; the complaint broke out about the middle of July, and, owing to showery weather at the time, spread very rapidly. After removing several barrow-loads of affected foliage, I commenced spraying with Burgundy mixture. This was continued once a week until the foliage was quite blue.

Last season the Celery was planted in another part of the kitchen garden, yet the disease appeared again during June, but amongst the white variety only. I at once commenced spraying with the following mixture:—4 lb. copper sulphate, 5 lb. washing soda, 1½ lb. soap, to forty gallons of water. Spraying was continued weekly until the foliage was blue, and the disease arrested.

Celery disease has been so bad in this district that many growers have given up cultivating this vegetable. *C. H. Harris, Old House, Coolham, Horsham, Sussex.*

## FOREIGN CORRESPONDENCE.

### SOYA BEANS JOINED IN PAIRS.

AT one of the meetings of the Scientific Committee of the French National Horticultural Society, MM. Vilmorin-Andrieux et Cie showed some Soya Beans joined in pairs. Two such cases were observed, one in a black-beaned Soya, the other in a yellow-beaned kind. The phenomenon seems to be of exactly the same nature as that which occurs among the curious Peas with joined seeds ("Caterpillar" Peas) which were studied at Verrières (see *Comptes Rendus de la 4e Conférence de Génétique, Paris 1911*; Ph. de Vilmorin—"Etude sur le Caractère 'Adhérence des grains entre eux' chez le 'Pois Chenille'"; et A. Meunissier, "Observations sur l'hérédité du Caractère 'Pois Chenille'" (*Genetica*, 1923).

But whereas, in the Peas, this characteristic is hereditary, it does not appear to be so in the case of the Soya; at any rate, two joined Beans found formerly at Verrières on a yellow-seeded plant and sown last year, did not reproduce the character. However that may be, it is a curious phenomenon, and serves to support the thesis of Professor Vavilov, "The law of Homologous Series in Variation" (*Journal of Genetics*, April, 1922), who maintains that the same series of variations is inevitably shown in allied plants. So far as I am aware, this curious anomaly has never shown itself in any other members of the Leguminosae except Peas. It would be interesting to know if it has been observed previously in the Soya. *A. M.*

### HARDY LILIES IN AMERICA.

THERE is a great and rapidly-growing interest in Lilies in America, much of which is undoubtedly due to the introduction of *L. regale*, and, the fact that it succeeds so well in all but the very warmest sections of the United States. This Lily is being extensively propagated, not only in the Eastern States but in Tennessee and other Southern States. The greatest plantings, however, are on the Pacific seaboard, especially in Washington, where the soil and climatic conditions appear to suit many Lilies. There are to-day in that State alone, a dozen growers with so many as 100,000 saleable bulbs each; one firm harvested so much as fifty pounds of seed, and a number of firms sow annually five pounds to twenty pounds of seed each, all in drills, out-of-doors. One grower from Seattle, August Swanson, informs me that from seeds sown in the spring of 1926 many of the seedlings would have flowered at the age of seven months had they not been cut down by early frost. This is better than we can do in the Eastern States, although I have flowered seedlings in thirteen months from seeds sown in cold frames early in May. *L. Willmottiae*, *L. Davidii* and *L. Henryi* have flowered within fourteen months under this same treatment.

The culture of both *L. speciosum* and *L. auratum* from seeds is being seriously taken up in Washington, and some of the plants have reached the flowering stage. *L. candidum* and some other species thrive there amazingly on land cleared of forest growth, and subsequently planted with a Leguminous crop, which is turned in before the Lilies are sown or planted. Even so uncertain a species as *L. sulphureum* does astonishingly well there, and *L. auratum platyphyllum* reaches a height of so much as fourteen feet. Splendid work is also being done at Ottawa and other places in Canada, in hybridising Lilies.

The call for Lilies which are less common than those named is growing all the time, and with this increasing demand is coming a better realisation of the needs of Lilies. In one respect we have an advantage over growers in Great Britain in the cultivation of Lilies, for though our winters in the Eastern States are much more severe, the ground remains frozen most of the time and there is usually a snow blanket, and when thaws come the water cannot percolate to the bulbs; also, while our hotter summers are a disadvantage in some respects, the brighter skies in winter ensure soils drying out much more quickly when the ground thaws out. *W. N. Craig.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Hardiness in Plants.**—The remarks on hardiness in plants by M. R., on p. 33, interested me, as I have always wondered why certain plants which I have seen grow and flower profusely in central Aberdeenshire—where the thermometer fell below zero on several occasions every winter during the years I lived there—will not thrive in the South of England. There was always a heavy fall of snow during such severe frost and later, in February or March, there was often 14° or 15° of frost. There were many large plants of *Dielytra spectabilis* in the herbaceous borders, which lived through severe winters and flowered profusely without any protection whatever. I have tried to establish this plant in the south, but have never been successful. Another plant that grows well in Aberdeenshire is *Gentiana acaulis*. I have seen it used as edgings round beds and borders, and when it grew too far out on to the path, we set a line down and chopped pieces off with a spade and wheeled barrow-loads to the rubbish heap. I know it is not want of hardiness that prevents this *Gentiana* growing here, but often I have wished I had some of the pieces which I used to throw away. There must be something in the soil which such plants as these dislike when they refuse to grow in certain districts. The winter of 1923-4 was exceptionally wet in the district where I was then residing in the West of England. There was scarcely any frost, and a batch of *Chrysanthemums* which had been in a border unprotected for years, was killed outright; and of a large batch of single *Pyrethrum*s only three or four survived. It is a mistake to cut off the old stems of plants of doubtful hardiness; such plants will often come through the winter without any other protection. I recollect sending a man to tidy up a border and cut down any plants that were withered. Before I noticed what he was doing, he had cut off the foliage of a *Tritoma* close to the ground, which killed it completely, as it never started the following spring. *Griгор Roy*.

**A Wonderful Chrysanthemum Exhibit.**—A fine effort, in whatever direction, is always worthy of note and record. Remembering the magnificent exhibit that was set up at the Brighton, Hove and Sussex Horticultural Society's show at Brighton, on November 10 to 12, last, I wrote for details. This exhibit, in the Dome, was a superb effort by the Brighton Corporation, arranged by its able Parks Superintendent, Mr. B. H. Maclaren. Occupying the whole space in front of the platform, this was of a size to easily accommodate within it the band that discoursed music throughout the show days. No fewer than 1,800 flowering plants of *Chrysanthemums* were employed, and an approximate total of 50,000 blooms displayed in an artistic group that included 150 Palms and *Dracaenas*, 400 Ferns, *Cyprus* and other ornamental foliage plants, and 600 *Abutilons*. The whole occupied a space of about 350 square yards, and was probably one of the finest groups ever staged in this country. Reference was made to this in the issue of *The Gardeners' Chronicle* for November 20, and the Corporation and Mr. Maclaren are indeed to be congratulated on their remarkable and beautiful effort. *E. Beckett*.

**Should New Plants be Ignored at the R.H.S. Shows?**—A few years ago, Mr. E. H. Wilson wrote an article on the flowering *Cherries* of the Orient. In this article he praised the beauty of the red-flowered *Prunus campanulata*, of *Formosa*, and mentioned a letter he had recently received from California, in which it was stated that this, "the most richly-coloured" of all the *Cherries*, was one of his best introductions. Surely no commendation could be more emphatic than this! I do not know how many plants introduced by Mr. Wilson from time to time have received the Royal Horticultural Society's awards, but the number must be large. His "best introduction," however, was ignored when I exhibited two flowering sprays of it at the meeting on January 25. This, in itself, is a matter of no import, but it seems

to me a regrettable circumstance that no record should be kept of the exhibition of such a rare and interesting plant. Two years ago, I sent up another *Cherry* which I have every reason to suppose had never been exhibited in England before. This also made no appeal to the Floral Committee. Moreover, they evidently did not consider it of sufficient interest to be shown in the main hall, for it was not to be seen when I revisited the exhibition in the afternoon. To the enthusiastic amateur who has taken the trouble to gather plants from the four corners of the earth, such treatment is certainly discouraging. Does scientific interest and rarity count for nothing among horticulturists? If the beauty of a tree or shrub is not apparent by the display of a single spray or branch under the present system, it seems to be mere waste of time and money to exhibit it. So far as the R.H.S. is concerned, whatever the intrinsic value of the whole plant may be, it passes for ever into oblivion. Would it not be possible to have a position devoted entirely to newly introduced species and a record kept of all those exhibited? It may be taken for granted that the average individual will not go to the expense of introducing plants of absolutely no ornamental or scientific interest. There are many of us who prefer the natural species to the more gaudy garden hybrids, but so long as the present system prevails, all such have no inducement to either visit or exhibit at the R.H.S. shows. *Collingwood Ingram*.

**A Long-Keeping Melon.**—I was delighted to see in your issue of January 15 a note from my old friend, Mr. A. J. Sanders, and feel I should like to corroborate it regarding the long-keeping Melon, as my name is mentioned as being the source whence he obtained the seed. In March, 1925, my son, who is chief engineer on the estate of Sir Lionel Phillips, Bt., Vergelegen, Somerset West, South Africa, sent me seeds of a fine green-fleshed Melon he had grown in the garden attached to his bungalow, and added remarks on its culture, stating that seeds were sown in the open ground and the plants grown the same way as Vegetable Marrows without any protection. No stimulants were given and water only until the plants were well established. The ground was well-manured previous to sowing the seeds. The plants were allowed to run at will with but little stopping and ripened a good crop of fruits which were much appreciated during the great heat of the South African summer. My son wrote me on December 22 last stating that the shade temperature then was over 100°. I still have a few seeds left from the original packet which I shall be pleased to distribute so far as they will go to any readers desirous of growing this long-keeping variety. *A. Alderman*, 10, *Burdett Road*, West Croydon, Surrey.

**Melilotus Species.**—I have three species of *Melilotus* growing under my charge in the Educational Gardens, Singleton, Swansea; all have yellow flowers. One of these, *M. indica*, is quite distinct and may be dismissed. The other two are distinct from one another and from *M. alba*, the white-flowered species growing by their side. The seeds of one of these was received from Messrs. Vilmorin, Andrieux and Co., Paris, and the other was collected on a waste heap. The one from Messrs. Vilmorin was named *M. officinalis*, and has probably been offered in their catalogue for a considerable number of years. In the course of writing out a list of our plants, I am confronted with a problem in regard to these two species. Bentham and Hooker give (1) "*M. officinalis*, Willd., syn. *altissima*, Thuill. and (2) *M. arvensis*, Wallr." Hooker's *Students' Flora* gives "(1) *M. altissima*, Thuill. syn. *M. officinalis*, Willd. and (2) *M. officinalis*, Desr., syn. *M. arvensis*, Wallr. The *London Catalogue* gives (1) *M. altissima*, Thuill. and (2) *M. officinalis*, Lam., syn. *arvensis*, Wallr., in both the 10th and 11th editions. If there is a simple solution to this I shall be very pleased to learn of it, for I have a very limited library, and in the list I am preparing I wish to mention those species which were used by herbalists, etc. In regard to these two I am still in doubt. *Cecil E. Marks*.

## SOCIETIES.

## READING AND DISTRICT GARDENERS'.

THE first fortnightly meeting of the spring session was held on Monday, the 24th ult., and notwithstanding the unfavourable weather, there was an excellent attendance. Mr. F. Townsend presided. The subject for the evening was "Winter-flowering Begonias," and the lecturer, Mr. C. Nippard, Ashton Court Gardens, Bournemouth, Secretary of the Bournemouth Gardeners' Association. The lecturer enumerated several ways in which these Begonias could be grown, and after giving a brief historical account of their introduction into this country proceeded to deal with their cultivation under the following headings: Propagation by leaf and stem cuttings; soils, temperatures, watering, manures and pests. The following varieties were recommended as some of the best.—Scarlet Beauty, Optima, Eclipse, Exquisite, Orange King Conquest, Gloire de Lorraine, The King, Lord Rothschild and Mrs. J. A. Peterson.

Mr. F. Priest, 50, Westbourne Terrace, Reading, received an Award of Merit for Cultural Skill for three varieties of Potatoes.

## GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

At a largely attended meeting of this Society, held on the 19th ult., and presided over by Mr. Thomas Dagg, a lecture on "The History and Production of Spring-flowering Bulbs" was delivered by Mr. John Cairns. He traced the history of the Hyacinth, Tulip and Narcissus from the time of their introduction into western Europe, and commented on the improvement that had taken place in these subjects from a horticultural point of view. Dealing with the Tulip, Mr. Cairns stated that the May-flowering Caledonia had been growing for years in a private garden at Longniddry, and was brought to the notice of Mr. Jan de Graaff of Leyden, who procured bulbs and took them to Holland. The flowers were very small and of a greenish colour with an orange edge to the petals, but when cultivated in Holland it produced flowers three times the size, the green colour disappeared entirely, and it resulted in the beautiful orange-scarlet as we know it. Testimony was paid to the work of William Backhouse, a banker in Darlington, and Edward Leeds, a stockbroker in Manchester, who were eminently successful in the production of Daffodils. Among other bulbs that came under review were: Iris, Crocus, Anemone, Chionodoxa, Fritillaria, Gladiolus, Ixia, Lilium, Muscari, Ranunculus, Scilla and Begonia.

## MARLOW AND DISTRICT CHRYSANTHEMUM.

THE annual general meeting of this Society was held at the Institute on Wednesday, the 19th ult. C. H. Yates, Esq., Vice-President, presided and was supported by Capt. A. H. B. Wright and Mr. J. Platt (Hon. Treasurer), while many other members were present. The Hon. Secretary, Mr. H. A. Elkington, of Oak Tree Road, Marlow, presented the Report of the Committee and Balance Sheet for 1926, which were adopted. It was agreed, after discussion, that the next annual exhibition should take place on Wednesday, November 9, 1927. A vote of thanks to the Chairman terminated the meeting.

The accounts show a balance in hand at the end of the year of £10 17s. 3d., as compared with 16s. 6d. in 1925. The improvement in the financial position is due to economies effected during the year by voluntary assistance of the officers and members of the committee, and has in no way detracted from the success of the Society. The exhibition was held at the Public Hall on November 3, and was a floricultural success, although the attendance was poor.

## GARDENERS' ROYAL BENEVOLENT INSTITUTION.

THE Annual General Meeting of the subscribers of this gardening charity was held on the 25th ult., at Simpson's Restaurant, Strand. There were present Messrs. Leonard Sutton, P. C. M. Veitch, P. R. Barr, W. Wallace, Charles H. Curtis, A. J. Wood, Jas. Hudson, Geo. F. Tinley, A. Bullock, A. Dawkins, J. Linford, H. G. Cox, P. G. White, D. Ingamells, Ralph Bond and Geo. Gollin, O.B.E. The chair was occupied by Mr. Leonard Sutton. After the minutes of the preceding meeting had been read and confirmed, the Secretary read the Report of the Committee for 1926, as follows:—

## EXTRACTS FROM THE REPORT.

THE Committee have the honour to submit their eighty-eighth annual report together with a statement of receipts and expenditure, as audited, for the year 1926, and in doing so desire to express their sincere appreciation of the liberal support they have received which has enabled them to continue to carry on the beneficent work of this national horticultural charity, which for nearly ninety years has ministered to the necessities of poor and distressed horticulturists.

During the past year several annuitants have passed away, two of whom left widows whose cases having been found to be eligible and deserving were placed on the funds without election for the widow's allowance for life, in accordance with Rule III, 13. Unfortunately, the applications for permanent aid are ever increasing—there are to-day on the list for election forty-eight candidates—thirty-one men and seventeen widows, some of whom are blind and paralysed. From this number the Committee recommend the subscribers to elect twenty. They regret they feel unable to recommend a larger number in view of the financial conditions affecting all charities at the present time. It is, however, a matter for much thankfulness that owing to the "Victorian Era Fund," and the "Good Samaritan Fund" each unsuccessful candidate will receive a certain sum—up to £12—as temporary assistance for the year 1927.

During the past year fourteen persons were helped from the "Victorian Era Fund"; twenty-seven from the "Good Samaritan Fund," and ten from the "Geo. Monro Memorial Fund."

The Committee are glad to be able to report that the eighty-first Annual Festival Dinner was again held, by kind permission of the Master and Court of Assistants

of the Worshipful Company of Grocers, on June 10, in their beautiful hall, when for the second time the Duke of Portland, K.G., presided, proved most successful and they desire to place on record their very grateful thanks to His Grace for his able, eloquent and convincing advocacy of the claims of charity, which brought such a substantial addition to its funds.

The Committee would also offer their sincere acknowledgments to the Worshipful Company of Grocers for their kindness; to the stewards; to the horticultural press; to the donors of flowers, etc., and to other friends who in any way assisted in making the festival a success.

The Committee are greatly indebted to the organisers of concerts, flower stalls and other entertainments on behalf of the funds, amongst whom may be mentioned Mr. Thomas H. Cook, Sandringham; Mr. W. Auton, Woking; The Worcester Auxiliary, Liverpool Auxiliary and the Committee of the Altrincham and District Gardeners' Improvement Society.

They likewise tender their warmest thanks to the Rt. Hon. Earl Beauchamp, K.G., the Rt. Hon. Lord Northbourne, The Viscountess St. Cyres, the Lady Battersea, Mr. C. W. Dyson Perrins, J.P., Mr. Roger Corbett, J.P., and Major R. W. Cooper, for again opening their beautiful gardens to the public for the benefit of the Institution.

The Committee specially desire to offer their best thanks to Messrs. Geo. Cobley, Kay and Co. (Chartered Accountants), and to Messrs. Ralph Bond, Veitch and Bilney (Solicitors), for their kind honorary services. Also to the honorary officers and committees of the several auxiliaries who work so ungrudgingly and successfully on behalf of the cause and whose services and help are so much appreciated.

The Committee have again with sorrowful and melancholy regret to refer to the large number of losses by death amongst the friends and supporters of the Institution they have sustained during the past year. They would especially mention the late Lt.-Col. Sir George Holford, a warm-hearted friend who was ever ready to help the work; the Viscountess St. Cyres, the Hon. Mrs. Elliot Yorke, Mrs. M. Monro, J.P., widow of the late George Monro, V.M.H., Rev. J. H. Pemberton, Rev. J. Jacob, Mr. W. C. Slocock, V.M.H., Mr. T. Coomber, V.M.H., and Mr. R. B. Leech, of Altrincham.

LEONARD SUTTON,  
Chairman of Committee.  
GEORGE J. INGRAM,  
Secretary.

Mr. Leonard Sutton, in moving the adoption of the Report, offered the best thanks of the meeting to the Committee for the excellent manner in which they had managed the Institu-

tion during the past year. He said the Institution was doing a memorable work, and although there was a small attendance on this occasion, the great success of the annual festival dinners showed that a very great interest was taken in the Institution by lovers of gardens all over the country. He was glad to know that the income had been well maintained during the past twelve months, and he appealed especially for more annual subscriptions; if everyone interested in gardening would do their best, he said, the Institution would be bound to continue as successful as it had been in the past ninety-eight years. The Report was one of gladness and sorrow. It would mean pleasure for those twenty-four needy persons who would be elected that afternoon, and regret for the twenty-eight unsuccessful ones, but they would be pleased to know that the Committee found itself in the position to add two more pensioners to the list. In addition to the pensions, the Institution maintained two other funds, the Good Samaritan Fund and the Victorian Era Fund, by which the Committee was enabled to help those who were not elected and those who needed help in an emergency. There was also, he said, the George Monro Fund which last year helped ten cases which would otherwise not have been assisted. Mr. Sutton said he could not move the adoption of the Report without paying a tribute to the valuable work done by the Secretary, Mr. George Ingram, whom everybody realised had the good of the pensioners at heart. They would all regret the losses the Institution has sustained in the death of many during 1926 who had supported the fund in the past, and he especially mentioned the late Sir George Holford.

Mr. C. H. Curtis, in seconding the adoption of the Report, said it was greatly to be regretted that the Institution was not in a position to elect all the candidates, all of whom were in need of help, and especially two who were blind and two partly blind. He would like to refer to the good work done by Mr. Cook and Mr. Auton, work that could be imitated by other gardeners, in raising money by organising concerts and entertainments of a similar kind; such social functions not only helped the Institution, they were needed in quiet country districts during the dull winter season. He very much regretted to inform the meeting he had just learned that Mr. Bayford, of Davenham Gardens, who had been such a valued supporter of the Institution for many years, had passed away. Mr. Curtis congratulated Mr. Sutton on being able to occupy the chair again, and expressed the pleasure of everyone present in seeing him restored to health.

The Report was adopted without further comment. The Secretary then read the Balance Sheet, which is published on this page.

The rest of the proceedings was of a formal nature and included the re-election of officers and committeemen. Mr. E. Sherwood was re-appointed Hon. Treasurer; Mr. George Ingram, re-appointed Secretary, and the auditors were also re-elected. The retiring members of Committee, Messrs. J. Clayton, C. H. Cook, T. H. Cook, Bernard Crisp, Wm. Robinson, Joseph Rochford, E. Sherwood, A. G. Watkins and A. J. Wood, were all re-elected.

At this stage the meeting adjourned for the scrutiny of the ballot, of which Messrs. D. Ingamells, H. Cox and P. White were appointed Scrutineers. The ballot was declared about 5 o'clock, the results of which were given in our last issue on page 76.

A vote of thanks to the Scrutineers and Chairman concluded the proceedings.

## BRITISH CARNATION.

THE past year has left the British Carnation Society in a favourable financial position, for although no great record has been made in regard to the addition of new members, the statement of Receipts and Expenditure placed before the annual meeting showed a balance in hand of £124 6s. 10d., while War Loan Stock to the value of £50 was purchased during the year 1926.

Perhaps more important than finance is the

## THE GARDENERS' ROYAL BENEVOLENT INSTITUTION GENERAL FUND.

FOR THE YEAR ENDED DECEMBER 31, 1926.

\*£1,250 is required to meet the quarterly payments due on December 31, 1926.

†Part of this amount is for investment in commemoration of H.R.H. the Prince of Wales' Presidency at Festival, 1924.

We have examined the attached Accounts of Receipts and Payments with the books and vouchers, and we certify that to the best of our information, they are correct.

We have also verified the Investments and the Bank Balances of the Institution.

(Signed) GEORGE COBLEY, KAY & CO.,  
Chartered Accountants. (Hon. Auditors).

work that has been accomplished. An effort which has not been unsuccessful has been made to bring out private exhibitors, and the prize list has been augmented. Efforts have been made to induce raisers to improve the quality of perfume in Carnations, and in this connection a Gold Cup to the value of £100 has been offered by the proprietors of the *Daily Mail* for competition at the show to be held at the Horticultural Hall, on March 29 and 30, to be awarded to the best scented Carnation registered with the Society since January, 1925. This Cup should do much to enhance the important quality of perfume.

The policy of publishing quarterly *Bulletins* on Carnations will be changed to the issue of a *Carnation Year Book*, as in pre-war days.

Considerable interest taken in the Carnation overseas is proved by the frequent correspondence received, these overseas members taking more advantage of the Society's panel of experts who are appointed to answer technical questions than British members themselves.

During the past year twenty-six new varieties were registered, but the high standard required in new varieties resulted in only one Award of Merit being granted—to the variety *Lady Hindlip*. The policy of the Floral Committee in setting this high standard has not passed unquestioned, but has been endorsed by the majority of well-wishers of the Carnation. The Annual Report contains a few words of congratulation to their past President, Mr. W. E. Wallace, J.P., on his award of the V.M.H. (Victoria Medal of Honour) the greatest honour that horticulture can bestow. The Society is fortunate in having had a president who is universally recognised as the finest exponent of Carnation culture.

Office-bearers for 1927 are Mr. H. T. Mason, President; Mr. C. Engelmann, Chairman; Mr. M. C. Allwood, Vice-Chairman; Mr. Laurence Cook, Hon. Treasurer; Miss Bunyard, Secretary, and Mr. P. F. Bunyard (whose address is 57, Kidderminster Road, Croydon), Hon. Secretary.

## MANCHESTER AND NORTH OF ENGLAND ORCHID.

THURSDAY, JANUARY 6: *Committee present*: Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. C. Branch, Mr. A. Burns, Mr. J. Cypher, Mr. A. Coningsby, Mr. J. Evans, Mr. A. Keeling, Mr. D. McLeod, Mr. E. W. Thompson and Mr. H. Arthur (Secretary).

### FIRST CLASS CERTIFICATE.

*Cypripedium Sumurun* (Christopher var. *Grand Duke Nicholas* × *niveum*).—A very large flower of the niveum section, of good shape, ivory white with a pink flush, the basal half of the dorsal and petals being minutely spotted with rose. From Capt. W. HORRIDGE.

### AWARDS OF MERIT.

*Odontoglossum eximium* var. *Royal Beauty*; *O. harvingtense*, Towneley Grove variety; *Odontioda Colinge* var. *Ruth*; *O. Vikings*; *Brasso-Cattleya British Queen* vars. *Profusion* and *Renown*; *B.-C. Penelope* var. *rubra*; and *Cypripedium Montcalm II*; all from J. B. ADAMSON, Esq.

*Cypripedium Arandora* (*Selene* × *Leeanum* var. *Adrian Lefebvre*); *C. Murillo* (*Selene* × *Carola*); and *C. Sunshine* (*Desdemona* × *concolor*). From H. J. BROMILOW, Esq.

*Cypripedium Major Hanbury Carlisle* (*Troilus* × *Lady Carlisle*), and *C. Golden Queen* var. *Gratixiae*. From S. GRATRUX, Esq.

*Brasso-Cattleya Hercules* var. *Etna* (*B.-C. The King* × *C. Luddemaniana*), and *Cypripedium G. V. Llewelyn* (parentage unknown). From G. V. LLEWELYN, Esq.

*Cypripedium Pioneer* var. *Dora* (*Desdemona* × *Zoe*). From Mrs. P. SMITH.

### CULTURAL CERTIFICATES.

To Mr. A. BURNS, for *Calanthes* in variety; *Odontoglossum grande*, and *Masdevallia tovarensis*. To Mr. J. HOWES, for *Brasso-Cattleya British Queen* vars. *Profusion* and *Renown* and *C. Dreadnought*. To Mr. C. BRANCH, for *Odontoglossum Henry VIII*. To Messrs. J. CYPHER AND SONS, for *Angraecum distichum*, and to Mr. J. EVANS, for *Cypripedium Becktoniae*.

### GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded; this included *Cypripedium* in variety, *Cattleya Urbania* var. *superba*, *Brasso-Cattleya Queen*, vars. *Profusion* and *Renown*, *Odontoglossum eximium* var. *Royal Beauty*, *O. asperum* and *Oncidium varicosum* Rogersii.

S. GRATRUX, Esq., West Point (gr. Mr. C. Branch), was also awarded a Gold Medal for a group that contained *Cypripedium* in great variety, notably *C. Major Hanbury Carlisle* and *C. Golden Queen* var. *Gratixiae*, with *Odontoglossum Senator*, *O. Henry VIII*, *O. Orestes* var. *Mary* and *O. crispum* vars. *Mary Gratrux*, *Aramis*, West Point variety, etc.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), staged a group to which a Silver-gilt Medal was awarded; *Calanthes* were prominent, and these included *C. Veitchii*, *C. William Murray*, *C. Kenneth* and *C. Byron*; *Cypripedium Armistice*, *C. Hermes*, *C. Lady Evelyn James*, *C. Mrs. F. Sander*, *C. Caractaus* var. *Janet Coffin* and *C. Maudiae*; *Odontoglossum grande* and *Masdevallia tovarensis*.

H. J. BROMILOW, Esq., Liverpool (gr. Mr. W. J. Morgan), showed *Cypripedium Arandora*, *C. Murillo* and *C. Sunshine*. G. V. LLEWELYN, Esq., Southport, exhibited *Brasso-Cattleya Hercules* var. *Etna* and *Cypripedium G. V. Llewelyn*. Mrs. P. SMITH, Ashton-on-Mersey (gr. Mr. E. W. Thompson), and Capt. W. HORRIDGE, Bury (gr. Mr. A. Coningsby), also showed *Cypripedium*s.

Messrs. J. CYPHER AND SON were awarded a Silver Medal for a group containing *Cypripedium Cupid*, *C. Moonbeam*, *C. Boltonii*, *C. Actaeus langleyense*, *Masdevallia Hincksiana* and *Angraecum distichum*. Messrs. KEELING AND SONS staged *Cypripedium*s, and Mr. D. McLEOD showed *Odontoglossum Helma*.

FRIDAY, JANUARY 21: *Committee present*.—Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. A. Coningsby, Mr. J. Evans, Capt. W. Horridge, Mr. A. Keeling, Mr. J. Lupton, Mr. D. McLeod, Mr. E. W. Thompson and Mr. H. Arthur (Secretary).

Owing to the inclement weather the exhibits were not so numerous as usual.

### AWARDS OF MERIT.

*Odontoglossum eximium* var. *Northern Star* and *C. Revelation* (parentage unknown). From J. B. ADAMSON, Esq.

*Cypripedium President Harding* (*Beryl* × *Lord Wolmer*) and *C. Eurybiades* var. *Remenham*. From A. M. BUXTON, Esq.

*Brasso-Cattleya British Queen* var. *G. V. Llewelyn* and *C. Mrs. G. V. Llewelyn* (*Hannibal* × *Beckmanii*). From G. V. LLEWELYN, Esq.

*Cypripedium Aureoma*, *Haddon House* variety (*Desdemona* × *aurea*). From Mrs. P. SMITH.

*Odontioda Nada*, *Beardwood* variety. From Col. Sir J. RUTHERFORD, Bt.

### CULTURAL CERTIFICATE.

To Mr. J. HOWES, for *Odontoglossum eximium* *Northern Star*.

### GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), was awarded a Gold Medal for a group of *Odontoglossum eximium* var. *Northern Star*, *O. Cobbiae*, *O. Thora*, *Cypripedium Revelation*, *C. Maudiae*, *C. Vashitii*, *C. Leeannum*, *Gurney Fowler*, *C. Memoria*, *F. M. Ogilvie* varieties *The King* and *The Premier*, *Lycaestes* of the Skinneri section; *Odontioda Charlesworthii*; *Xylobium leontoglossa* and many other good things. Col. Sir J. RUTHERFORD, Bt., Blackburn (gr. Mr. J. Lupton), was awarded a Silver Medal for a group containing *Odontoglossum Queen Alexandra*, *O. Grand Duke Michael*, *O. ardentissimum* var. *Johnsonii*, *O. loochristiense* var. *R. le Doux*, *Odontioda Nada*, *O. Beardwood* var. *Coline* and *O. Charlesworthii*.

A. M. BUXTON, Esq., Wilmslow (gr. Mr. Pask), staged *Cypripedium* President Harding, *C. Eurybiades* var. *Remenham*, *C. Lady Dillon* and *C. Thompsonii* hybrids with *Miltonia Bleuana*. G. V. LLEWELYN, Esq., Southport, showed *Brasso-Cattleya British Queen* var.

*G. V. Llewelyn* and *Cypripedium* Mrs. G. V. Llewelyn. Mrs. P. SMITH, Ashton-on-Mersey (grower Mr. E. W. Thompson), exhibited *Cypripedium Aureoma*, *Haddon House* variety.

Messrs. CHARLESWORTH AND Co. sent *Cypripedium* Mrs. Alfred Hanbury, *C. Renown*, *Odontoglossum Ithone*, *O. Muralie* and *Odontioda Acis*. Messrs. KEELING AND SONS, staged *Cypripedium*s in variety.

## Obituary.

**James Udale.**—Death is taking heavy toll of veteran horticulturists, and it is our painful duty to record the death of Mr. James Udale, who passed away at Droitwich on January 28. Born at Uttoxeter, he was employed at numerous important places, such as Oldfield Hall Gardens, Uttoxeter; the Barrowash Nurseries, Derby; the Garston Vineyards, Liverpool; Worksop Manor, and Lilleshall House Gardens, Shropshire. His first position as gardener was with Sigismund Cohen, Esq., at Manchester, a shipping merchant, who made a hobby of Orchids and imported specimens direct from South America. It was while in this position that Mr. Udale's ambition was fired and ere long he decided that a much wider knowledge of plants was necessary to fit him for more important positions. He obtained an appointment at Kew, where he eventually became sub-foreman of the Orchid department, and acquitted himself in other directions. From Kew he went to take charge of Sir H. Watson's gardens at Shirecliffe Hall, Sheffield, where he remained for eleven years before becoming gardener and clerk of the works on the Elford Estate at Tamworth. Here he had a fine opportunity, and made the most of it, but, unfortunately, his health gave way. In 1891 he was appointed Lecturer in Horticulture for Worcestershire, and he served this county admirably for the rest of his life, taking especial interest in the working out of trials and tests concerning fruit trees and vegetables. A man of fine presence, great natural ability and forceful character, he combined a wide horticultural knowledge with the ability to demonstrate that knowledge by means of lectures and contributions to the press. Over a very long period he was a frequent contributor to *The Gardeners' Chronicle*. Mr. James Udale, who was seventy-six years of age, believed himself to be a descendant of the famous Dr. Uvedale (often spelt Udale) of Enfield, the first known cultivator of the Sweet Pea in England, and after whom Uvedale's St. Germain Pear is named.

## ANSWERS TO CORRESPONDENTS.

**CYPRIPEDIUM BLOOMS TURNING BROWN.**—W. T. The cause of the *Cypripedium* blooms failing to develop is probably due to one or the other of the reasons given below, but it is impossible to give a definite reason from your letter. Have fumes from the gas stove entered the house? Has the stove gone out, whilst the house and the plants were in a saturated condition? A low temperature heavily charged with moisture might be the cause. We advise a higher temperature and drier conditions in the house; a temperature of 50° is not sufficient to develop *Cypripedium* flowers to perfection, especially during dull, damp weather.

**GARDENER'S WAGES DURING ILLNESS.**—H. W. and *Wondering*. The question really turns upon whether the incapacity caused by the illness is permanent or temporary. Permanent incapacity in a servant caused by illness justifies the master in treating the contract of service as at an end; but temporary illness does not put an end to the contract, and the servant is entitled to his wages during his absence through temporary illness, provided that the contract of service remains in existence during that time, and that he is ready and willing to carry out his duties save for the incapacity produced by the illness.

**Communications Received.**—G. H.—H. F.—W. H. M.—S.—W. H. J.—W. C.—J. H. W.—S. D. (Thanks for 1/ for R.G.O.F. Box).—H. H. W.—E. R.

## MARKETS.

COVENT GARDEN, Tuesday, February 1st, 1927.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

Violets...	per doz.	8 0-5 0	

REMARKS.—Daffodils, Narcissus Soleil d'Or and Tulips are more plentiful and gradually improving in quality. A better selection of Tulips is on offer and the varieties now

include double-red and double white. Increased supplies of Narcissus ornatus are expected this week, and prices for this useful flower will probably become lower during the next few days. Prices of Richardias (Arums) and Lilium longiflorum have remained firm during the past week, but to-day were easier again. Snowdrops and Violets are arriving in large quantities, also some special long-stemmed Freesias from home-growers. Larger consignments of Daffodils, white and yellow Narcissus, Violets, Freesias and Anemones are being sent from the Channel Islands. Business in French flowers is more brisk and prices are generally easier. Acacia (Mimosa), Anemones, Marigolds, yellow Marguerites and Violets are plentiful. The newest subjects in this department are Narcissus Grand Monarque and Gloriosa, also a few baskets of double white Stock.

REMARKS.—Business has not been particularly brisk during the week, but probably no worse than usual for the season of the year. Increasing shipments of Peaches and Plums from South Africa have been received; the fruit being in excellent condition has sold well. The Apple market is quiet, and even the demand for best home-grown Bramley's Seedling is less keen, the comparatively high prices, no doubt, being responsible. English and Belgian Grapes are selling well, due to the large amount of illness in the country. There is an active demand for good Oranges, and Lemons are a steady trade. Cucumbers have reached an exorbitant price, probably because supplies are very small. Tomatoes from the Canary Islands are selling freely. Forced vegetables show very little fluctuation in value. Beans are selling at the highest prices realised for some years past. Guernsey new Potatoes are a fair business, and new Potatoes from the Canary Islands and Azores are a moderate trade. Forced Rhubarb is plentiful and cheap. Green vegetables remain a steady trade. Salads are abundant but not particularly cheap. Trade in old Potatoes continues to be good with an active demand for best sorts.

## GLASGOW.

Trading during the past week was restricted to an exceptional degree by a succession of violent storms which reached their height on Friday afternoon, when the velocity of the wind recorded at Coats Observatory was 102 miles per hour. In the fruit market no quotable change in prices occurred, but Apples and Oranges were fairly plentiful and cheap. The cold weather has affected the consumption of these and other fruits, more particularly Grape Fruit, consequently keen buyers generally succeeded in obtaining small concessions.

No particular feature developed in the cut flower section. Supplies were about normal for the time of the year and just satisfied trade demands, consequently price movements one way or the other were small. Tulips low dominate the market, and the following quotations represent the highest and lowest values of the week:—William Pitt, 2/- to 2/6 (6's); Bartigon, 1/9 to 2/-; Lucretia, 1/9; Rose Tendre, 1/6; Prince of Austria, 1/3 to 1/6; Couronne d'Or, 1/2 to 1/4; Tea Rose, 1/3; Ibis, Flamingo and Murillo, 1/- to 1/3; William Copland, 9d. to 1/3; La Reine, 10d. to 1/2; and Yellow Prince, 2/6 for 12's.

Prices of Narcissus remained firm at 7/- per dozen bunches, while those of Daffodils were steady at 2/- to 2/6 per dozen for King Alfred, and 10d. to 1/- for Golden Spur. White Hyacinths averaged 8d. per bunch (3's). Chrysanthemums were represented by Favourite at 10d. to 1/6, and Heston White at 8d. to 9d. Carnations were worth 3/6 per dozen. Violets realised 2/-; Lilac, 1/6; Snowdrops 3/-; Lily-of-the-Valley, 1/9; and Asparagus, 1/3 to 1/6.

## TRADE NOTE.

MANY years have passed since we drew the attention of certain enthusiastic allotment-holders to the fact that a box twelve inches square, when filled with soil, gave 144 square inches of surface, and if one seed were sown in each square inch it would be more likely to develop into a healthy seedling than if seeds were sown broadcast over a similar surface. In later years the T. P. Seed Box Co. have gone "one better" by providing individual cartons for the seeds of Sweet Peas, etc., and all so arranged that forty-eight fit into a hinged box that is handy for removal as needed, from greenhouse to frame, and particularly handy at planting time, since each seedling may be transplanted without disturbing its neighbours, while the prepared carton will by that time be easily removable without harming the roots. For small seeds and seedlings cartons or "raisers" one-and-three-eighths-inch across and four-and-a-half inches deep, are made, while for larger subjects there are "raisers" measuring three inches square by four-and-a-half inches deep, a dozen fitting into a neat box. Amateurs especially, will appreciate the advantages of the T. P. Seed Raisers, as their use removes the need of "pricking out" the small seedlings.

## GARDENING APPOINTMENTS.

Mr. E. A. Norris, late of Moor Park, and previously at Dany Park, Fairfield, Northleigh, and Woodleigh, Bradford-on-Avon, Wiltshire, as gardener to FRED H. REEVES, Esq., Bearnett House, Penn, near Wolverhampton. (Thanks for 3/- for R.G.O.F. Box.—EDS.)

Mr. G. Woods, for the past three years second gardener at Rongham Hall, Bury St. Edmunds, as gardener to Major ASHLEY DODD, Otley House, Otley, near Ipswich. (Thanks for 1/6 for R.G.O.F. Box.—EDS.)

# RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

Send for a copy to-day, to:

THE GARDENERS' CHRONICLE, LTD., 5, Tavistock Street, London, W.C. 2.

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to advertisers of vacant situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

### CITY OF MANCHESTER.

BAGULEY SANATORIUM (333 beds),  
Near Altrincham, Cheshire.

#### HEAD GARDENER.

THE Public Health Committee require the services of a WORKING HEAD GARDENER for the grounds, greenhouses (Tomatoes, Cucumbers, flowers, plants, etc.), and kitchen garden, at the above Institution. Wages, £3 0s. 0d. weekly, with emoluments (house, coal and light, valued at £44 16s. 0d. per annum).

Candidates must be married, and not more than 40 years of age, and preference will be given to ex-Servicemen.

Applications, with copies of three recent testimonials, to be sent to the Medical Officer of Health, Civic Buildings, 1, Mount Street, Manchester, on or before the 19th February, 1927.

Canvassing in any form, oral or written, direct or indirect, is strictly prohibited.

The person appointed will be required to be medically examined, and to contribute to the Corporation Superannuation Fund.

P. M. HEATH,  
Town Clerk.

Town Hall,  
Manchester,  
27th January, 1927.

# SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

## SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required; but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid it will appear the following week, unless countermanded in the meantime.

## PRIVATE.

**GENTLEMAN - PROFESSIONAL**, Fellow Royal Horticultural Society (widower, no children), seeks post as HEAD GARDENER, where three or more kept; highest reference last employer.—Write, CAPTAIN SAUNDERS, c/o Stagg, Denville Club, 4th Avenue, Havant.

## CALENDAR OF GARDEN OPERATIONS

Price 2/6, post free 2/10.

The CALENDAR OF  
GARDEN OPERATIONS  
is indispensable and un-  
rivalled, because it represents  
the accumulated experience of  
over half-a-century. Origin-  
ally compiled by Sir Joseph  
Paxton, it has been re-  
vised and enlarged by the

staff of The Gardeners'  
Chronicle until it is  
now as nearly perfect a  
gardening guide as any that  
exists. Its claim to be a  
"calendar" is undoubted,  
as the work to be done is  
arranged under the heading  
of each month.

**RHODODENDRONS FOR EVERYONE**

By F. KINGDON WARD.

**PRICE - 3s. 9d. - POST FREE.**

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, February 9, 10 a.m. Bar. 30.5. Temp. 36°. Weather, Fine.

WE are accustomed to regard the investigations carried out at East Malling as models of what horticultural investigations should be, and this attitude is confirmed by the study of Mr. Massee's brief account\* of that vexatious and expensive pest, the big bud mite (*Eriophyes ribis*), which is in no small measure responsible for rendering plantations of Black Currant unfruitful. Mr. Massee's experiments appear to show conclusively that it should be possible, in future, and at almost negligible cost, to eradicate this pest, or, at all events, so keep it under control that the mite shall cease from serious troubling. Like all sound pieces of work on plant pests, Mr. Massee's is based on a thorough exploration of the habits of the pest. In the course of this exploration, he found that the mite, which as Fig. 54 shows, exists in vast numbers in the big buds, remains in unapproachable seclusion during the greater part of the year. But in the spring "wanderlust" overtakes it as it overtakes so many forms of life, and the mite sallies forth from its fastness and finds fresh quarters—generally on neighbouring Black Currant bushes. Before, however, it finally deserts the bud in which it was brought up, the mite browses awhile on the surface of the bud. This habit it is that has led to its undoing by the able hands of Mr. Massee. If, as he rightly argues,

\* East Malling Research Station. Annual Report, 1925. The Control of Black Currant Mite, by A. M. Massee.

the mite, lingering for a last lick of the big bud from which it has just found release, can be fed on food mortal to it, it will migrate not to another bush, but to another world. A pabulum which produces this lethal effect is lime-sulphur, and, therefore, if the application of lime-sulphur (one part to eleven of water) be properly timed, the trouble will be scotched, because the mite which works it will have been killed. So long as the enemy is within the leafy walls of the bud, lime-sulphur is powerless to harm it; but when the mite emerges from the partly-opened bud, the layer of lime-sulphur deposited by spraying the bushes a little while before that time will suffice for its destruction. The remedy has often been advocated and applied before, but it proved only partially successful because of faulty timing. It is because he has found the joint in the mites' armour and has observed the moment at which to pierce it that Mr. Massee deserves our thanks. Anyone who studies the illustration in Fig. 54 may see for himself when that moment occurs. Some time between the last week in March and the second week of April—according to season and variety—the flower- and wood-buds of the Black Currant open. Just after the flower trusses have appeared and before the flowers themselves have opened is the proper time to spray. Lime sulphur applied then destroys, as Fig. 56 shows, the swarming multitudes of mites. It must be remembered, however, that remedies are rarely perfect. In the present case, the imperfection of the remedy is due to several facts. In the first place, some stragglers are bound to be left. In the second place, some buds may not open till much later; for, beside the ordinary big buds, the bigness of which is the sign of the presence within of the mite, other buds showing no sign of bigness may also harbour them. It is for this latter reason that other methods of eradication have so often failed; for example, hand picking and cutting back in alternate years, methods which we, ourselves, have often tried without any large measure of success. It is due to this also that nurserymen, no matter how vigilant they may have tried to be, have, in fact, often been in the past unwitting agents in despatching the mite about the world. Now, however, anyone who allows his plantation to become infested—and infested it will become in a few years, even though only one bush were infected originally—deserves to be regarded as a pest himself. For systematic spraying with lime-sulphur at the right time will keep the mite under sufficient control to prevent it destroying the fruitfulness of our plantations and those of our neighbours. For this, as for so much other help in time of trouble, our thanks are due to the East Malling Experiment Station. It would be a graceful act if all who profit by this advice were to express their appreciation by becoming members of the Kent Incorporated Society for Promoting Experiments in Horticulture, of which Society East Malling is the Research Station.

## Imports of Nursery Stock into Canada.

The Destructive Insect and Pest Act Advisory Board of the Department of Agriculture, Canada, states that the Board's inspectors at ports of importation are having considerable difficulty in identifying and checking consignments of nursery stock, owing to the fact that the containers of the shipment are not properly marked. The regulations under the Destructive Insect and Pest Act (Canada) demand that upon each container (unless the shipment is forwarded by parcel post) there be marked the following information: 1, name and address of consignee; 2, name and address of consignor; 3, kind or

kinds of nursery stock contained, and quantity of each; 4, the permit number. Failure to comply with this regulation may result in shipments being detained at the port of importation. The shipper should always secure the permit number before forwarding the shipment. The handling of shipments by the Board's inspectors will be greatly facilitated if the information required is placed upon either end of the container, rather than on a side, etc.

## Compensation for a Gardeners' Widow.

Mrs. Alice Wood, widow of the late Mr. C. H. Wood, who died as a result of an abrasure of the skin while cutting a tree in Tooley Street, London, in November last, has had a claim for compensation registered at the Southwark County Court for £535 16s. 0d., on the 27th January. The claim was made on her behalf by the National Union of Corporation Workers, of which Union Mr. Wood was a member. A staff collection on behalf of Mrs. Wood realised over £35.

## A Clever Viennese Business Woman.

During the present month of February, the fortieth anniversary is being celebrated of the entry into business of a clever Viennese woman, Frau Chlebecek, who has developed and brought to an outstanding success a business which scarcely existed until then. In February, 1887, her brother, August Denk, opened a shop in the New Market, Vienna, for the printing, in letters of gold, of messages on the ribbon bows which are used for tying funeral wreaths and flower sheaves. These large bows, with their gilt letters, are so little seen in this country that it is difficult to imagine the industry ever attaining such proportions as it has reached in Vienna, largely, if not entirely, owing to the industry and perseverance of Frau Chlebecek. After twenty-four years in the New Market, she was in a position to take larger premises in the Köllnerhofgasse, where the business is still conducted.

**Capt. F. Kingdon Ward.**—Our readers will be pleased to learn that Capt. F. Kingdon Ward has returned safely from his ninth plant-collecting expedition in eastern Asia. He is in good health notwithstanding several unpleasant experiences, including the depression that comes to a solitary white man while sojourning in a country where the rainfall is almost incessant. Most of his collections have now reached this country, while many seeds sent previously are already in the hands of those directly interested in his expedition. In our next issue Capt. Kingdon Ward will resume the story of his travels and describe the more important plants he found.

**Authenticity of Forestry Census.**—In his presidential address to the Edinburgh University Forestry Society, Lord Clinton surveyed the history of British forestry and remarked that the nation had not even now fully recognised the real necessity of a forest policy. He saw the gravest dangers in the proposals which were not infrequently made that the work of the Forestry Commission should be transferred to a Government Department under a political head. He could imagine nothing that would be more fatal to a continuous policy. Towards the close of his address, Lord Clinton stated that the census of production and the census of woodlands had been completed. The figures showed that in England and Wales the area under woodlands was approximately the same as in the previous census taken by the Board of Agriculture in 1913, but in Scotland there appeared an increase of 200,000 acres. Knowing the large area cut during the war and the lessened activity in planting owing to increase of taxation and break-up of estates, it was difficult to reconcile that increase with one's own knowledge. He had reason to doubt the accuracy of the present census, and if an error existed it was probably due to some inaccuracy in the previous return.

**Horticultural Club.**—Over forty members and their friends were present at a dinner and lecture of the Horticultural Club on Tuesday last, at the Trocadero Restaurant, Piccadilly Circus. Mr. W. B. Cranfield presided, and Mr. H. Cowley, editor of *Gardening Illustrated*, gave an address, illustrated by lantern slides,

entitled "A Vagabond in Majorca." Mr. Cowley made the journey for the special purpose of finding *Paeonia Cambessedesii* in its native habitat. He gave a very interesting account of his trip and described the scenery and industry of the island. In some of the valleys, such as that of Soller, the vegetation is luxuriant, and the scenery most delightful. The inhabitants are principally devoted to agriculture, and Mr. Cowley stated that although they adopted very primitive methods, they obtained excellent results. Majorca is the largest of the Balearic Islands and belongs to Spain, but others, such as the Romans and Moors, have left their influence on this old-world place, which the lecturer stated was several centuries behind the rest of Europe. Amongst the many excellent illustrations thrown on the screen was one showing the method of irrigating the land by means of water raised from a well by a mule or donkey, a device that could be traced back to the Moorish occupation of the island. Mr. Cowley was fortunate in finding, at Alcudia, an English resident, Capt. Munn, with a beautiful garden, for the climate is favourable to almost all kinds of sub-tropical and temperate plants, although the inhabitants express wonder why any person should grow flowers and not vegetables. One of the most delightful pictures showed *Ramondias* growing vertically in crevices in little caves, where they are shaded from the hot sun. Although he searched for the well-known *Arenaria balearica* Mr. Cowley only found very few plants, and yet in our gardens it spreads so freely as to become a nuisance. The old Olive trees, which were said to have been introduced by the Moors, have gnarled and contorted stems, yet, curiously enough, the upper part makes a compact head and the trees fruit freely. The Aleppo Pine, *Pinus halapensis*, is a conspicuous feature of the scenery and in some parts there is sufficient timber to support a charcoal-making industry; photographic slides showed the charcoal burner's primitive dwellings made with straw supported on poles. Mr. Cowley exhibited lantern slides of some wonderful plants of the *Paeony* he especially sought, and he also showed pictures of *Helleborus corsicus*, *Chamaerops humilis*, *Dictamnus Fraxinella*, *Eriobotrya aponica* and *Urginea maritima*, which is officinal, and planted by the inhabitants amongst sickly trees of Olives and others in the belief that they help to restore them to health. At the conclusion of the lecturer's address, Mr. Peter R. Barr related his experiences of a visit to the island and recommended all who could to visit Majorca, for no more delightful place could, he said, be chosen for spending a holiday than this old-world island.

**Sale of Leeds Castle, Kent.**—Leeds Castle, near Maidstone, with its surrounding estate, has been sold by Mr. Fairfax Wykeham-Martin and his trustees to Mr. and Mrs. Wilson Filmer. The present mansion is about one hundred years old, but it stands on a site on which there have been fortifications from a very early date, and its records are continuous from the days of the Norman Conquest.

**Arsenic on American Apples.**—A Middlesex greengrocer has been fined £1 and costs for selling American Apples "containing" arsenate of lead. Mr. Robinson, who prosecuted on behalf of the Middlesex County Council, stated that the publicity given last year should have caused American Apple growers to minimise the use of arsenic spraying, but they had not done so; in the case dealt with the amount of arsenic present was .05 grains per lb., while lead was present to the extent of .56 grains per lb. He warned greengrocers that all American Apples should be washed and cleansed before being offered for sale. This was sound advice, but it seems to us the powers that be should not admit American Apples unless they are free from arsenical deposit; most troubles and difficulties are best dealt with at their source.

**Sad Death of a Young Gardener.**—James Hall, an employee in the gardens at Haystoun House, Peebles, the residence of Sir Duncan E. Hay, was found dead on the 7th inst., having been overcome by gas fumes while stoking a furnace. He was only sixteen years of age.

**Dr. J. B. Hurry.**—For many years before going to live at Bournemouth, Dr. Hurry grew a large and interesting collection of economic plants at Reading, some in demonstration plots and others under glass. In addition, he formed a collection of products illustrating the economic value of the plants he cultivated. These collections were open to the public on half-holidays and Sundays, and were frequented by a large number of interested people, including children. Dr. Hurry's main purpose has been to emphasise the importance of studying the economic plant together with the product it contributes to the service of mankind, and this purpose was abundantly fulfilled in the garden and museum at Westfield, Reading. Dr. Hurry considers that local authorities possessing parks and pleasure grounds should, for educational purposes, allocate a small plot for hardy, and a glasshouse for tender, economic plants, and arrange a small museum of Economic Botany adjacent to the Economic Garden. He has pointed out that the necessary expenditure need not be heavy. Of course, every plant

DR. J. B. HURRY.

should be labelled correctly with its English and scientific name, its Natural Order, habitat, and the product that makes it useful to mankind. The fine collections Dr. Hurry formed he has now presented to the Reading University, where the economic products will form a museum of Economic Botany that cannot fail to be of great interest and educational value. The collection is housed in a separate room which has been added to the Museum, and was officially opened by Dr. Hurry, on Tuesday, January 25. A thoroughly useful catalogue has been compiled in which the various stages are arranged under (a) miscellaneous food products; (b) Nuts; (c) fibres; (d) woods and barks; (e) gums and resins; (f) medicines, and (g) dyes. In each case there is a brief description of the particular subject, its popular, as well as its scientific name, and usually a few particulars regarding the use of the particular product and the native habitat of the species concerned.

**Bequest to a Gardener.**—The late Lord Bearsted, of The Mote, Maidstone, left an annuity of £100 to his gardener, Mr. William Bacon.

**R.H.S. Scholarships.**—A scholarship of the value of £50 a year for two years is offered in alternate years by the Worshipful Company of Gardeners to be awarded on the results of an examination designed to test the candidates' ability to profit by a course of instruction in horticulture. The questions will not be confined to horticulture. Candidates must be

of the male sex and between the ages of eighteen and twenty-two years on October 1, 1927. The scholarship will be tenable for two years, of which at least the first year must be at the Society's School of Horticulture at Wisley. The second year may, in certain circumstances to be approved by the Council and the Worshipful Company of Gardeners in each instance, be spent in education elsewhere. Candidates must either have obtained a school-leaving certificate or have been already engaged in horticulture for at least two years before October, 1927. In the intervening years a similar scholarship will be offered by the Society. A Scholarship of £30 a year for two years, established by Sir James Knott, Bt., is also offered for award on the same conditions. Candidates must be able to produce certificates of good character, and must be of good health and physique, free from any physical defect that would militate against a career as a gardener, and willing to subject themselves to the rules for students at Wisley. In 1927, the examination will take place from 6 p.m. to 9 p.m. on Wednesday, May 4th. It will be held in as many different places in the British Isles as circumstances may demand, provided that a magistrate, clergyman, schoolmaster or other responsible person accustomed to examinations has signified, by signing the candidate's entry form, his willingness to act as supervisor. Any candidate who wishes to do so may take the examination at the Society's offices, Vincent Square, S.W.1, where arrangements will be made by the Society. Candidates must enter their names on or before March 31, 1927, with the Secretary, Royal Horticultural Society, Vincent Square, London, S.W.1, from whom entry forms may be obtained. An entry fee of 5s. must be sent with the completed form. Four scholarships, tenable for two years, carrying remission of fees and a maintenance grant up to £85 a year (depending upon circumstances) are also available at Wisley for young gardeners with at least three years' experience in private gardens or nurseries, and appointments to these are made after due consideration of experience, attainments, and other circumstances. Two scholarships are available to commence in October, 1927. Candidates should send in their applications before August, 1927, on forms which (with further particulars) may be obtained from the Director R.H.S. Gardens, Wisley, Ripley, Surrey.

**Manchester Parks and Cemeteries Department Society.**—So far as our experience goes, the only public parks department with a Society for the furtherance of its own interests is the one at Manchester. The staff of the Parks and Cemeteries Department of the City of Manchester numbers some seven hundred, and Mr. W. W. Pettigrew, the Chief Officer, is President of the Society, while Mr. J. Williams, in charge of Birchfields Park, is chairman, and Mr. L. E. Morgan, N.D.H., Hon. Secretary and Editor of the *Journal*. There are weekly meetings of the Society and special classes are arranged to afford educational facilities for the young men, the various subjects being taken by thoroughly qualified men who are in charge of the various parks; many of the young men are coached for the R.H.S. examinations. Once a month a special meeting is held in the Mayor's Parlour, when a lantern lecture is given and Mr. Pettigrew presides. Lectures during the 1926-7 session have been given by Mr. F. W. Parker, Deputy Chief Officer, Parks Department, L.C.C.; Mr. T. Hay, Superintendent of Hyde Park; Dr. G. H. Carpenter, the Museum, Manchester University; Mr. A. S. Galt, Leeds University; Prof. O. T. Jones, Manchester University; and Mr. Charles H. Curtis, Managing Editor of *The Gardeners' Chronicle*, who gave a lecture on "A Horticultural Journalist's Year" on Wednesday, February 2nd, when the audience numbered over one hundred. The concluding special lecture will be on "Kew Gardens: their History, Work and Value," by Mr. J. Coutts, Assistant Curator, Royal Gardens, Kew, on March 2. The Society is composed of and managed by the staff of the Parks Department and is, we believe, unique in this respect; we do not forget the Kew Gardeners' Mutual

Improvement Society, but this is attached to a garden that comes under a Government Department; the Old Chiswick Gardeners' Society was attached to the R.H.S. Gardens, and gardeners other than Chiswick men were admitted, but the Manchester Society is on different lines to either of these and is doing a splendid work that, fortunately, the City Council thoroughly appreciates and encourages.

**Scottish Nurseries Damaged by the Storm.**—The hurricane which swept over Scotland on the last Friday of January caused a vast amount of destruction in nurseries and market gardens situated in the western and midland areas where the velocity of the wind was at its maximum. At Kippen Nurseries over 5,000 square feet of glass were demolished, and the wooden frame-work of houses broken, but, fortunately, the big vine escaped, none of the three houses in which it is accommodated being damaged beyond the loss of a few odd panes of glass. At the Ellenbank Nurseries of Messrs. Scott Brothers, five Tomato houses, each measuring 200 feet long and fifteen feet wide, were completely destroyed. The houses occupied an elevated and exposed position and, as showing the fury of the storm, the ironwork which supported the roof, the base of which was sunk into two feet of solid cement, were torn up, twisted and broken, while the cement was forced into the air. Two other growers in the district had all their glasshouses blown down and they are left without a square foot of glass at the beginning of the Tomato season. At Messrs. Austin and McAslan's, Cathcart Nursery, the large house containing Rhododendrons, Azaleas, etc., was wrecked.

**William Willett Memorial.**—The scheme to acquire Pett's Wood, Chislehurst, as a memorial to the late Mr. William Willett, the founder of Summer Time, has materialised, and the committee has purchased nearly the whole of the eighty-seven acres of the wood, leaving only sixteen acres of frontage land, which can be obtained later, as the owner has agreed to withhold it from the builder so that if further funds become available the money can be applied in its purchase. The seventy-one acres already acquired are being conveyed to the National Trust, and will be opened to the public when Summer Time commences again.

**Potato Trials in 1927.**—The National Institute of Agricultural Botany is now prepared to accept entries for its sixth series of yield and quality trials of new varieties of Potatoes from breeders who are willing to entrust the Institute with the marketing of their productions on a profit-sharing basis. The trials are planned to last for five years, at first in Scotland only, but in the later years also in the English Potato districts. Only those varieties which do sufficiently well in the trials will be placed on the market. Full particulars of the conditions of the trials are given in a form of agreement, which can be obtained from the Secretary, National Institute of Agricultural Botany, Huntingdon Road, Cambridge, to whom those intending to enter new varieties for these trials should apply, not later than February 28, 1927.

**A New Azalea Disease in Germany.**—Attention is drawn in *Blumen und Pflanzenbau* (vol. XLI, pp. 166-167) to a serious leaf disease which broke out in Azaleas in a market garden at Munich in 1926. The disease, which is attributed by Mr. K. Flachs to the fungus *Septoria Azaleae*, so severely crippled the foliage that very large numbers of plants were rendered unfit for sale. It, moreover, weakens the plants and the new growth is much impeded. Two varieties were particularly affected, namely, Madame Petrick and Madame Aug. van Damme, both of which had been imported from Belgium the previous autumn. The disease was also found in other nurseries, and has been known to exist in Germany for several years previously. So far as we are aware this fungus is not known in England, but it is obvious that gardeners should be on the alert against a disease which may cause serious trouble. We shall be glad to examine any specimens submitted by our readers.

**London Square Gardens.**—A paper on the subject of the London Squares was read at a meeting of the Surveyors' Institution on February 7, by Mr. Frank Hunt, in the course of which he stated that over forty Acts of Parliament had been passed relating to the management and maintenance of the gardens. Mr. Hunt further stated that the largest square in London was Cadogan-place, Chelsea (7.43 acres), others in order of size being Lincoln's Inn Fields (6.84), Eaton Square (6.33), Russell Square (5.91), Park Square, St. Marylebone (5.59), Belgrave Square (4.73), and Grosvenor Square (4.44).

**Imperial War Graves Commission.**—Capt. E. C. Symons asks us to state that, owing to reduction of staff, the Imperial War Graves Commission has been compelled to dispense with the services of one hundred and forty gardeners. In all cases these men are leaving entirely owing to the necessary reduction in staff and the Com-

meeting. **TUESDAY, FEBRUARY 15:** Winchester Horticultural Society's meeting. **WEDNESDAY, FEBRUARY 16:** Royal Gardeners' Orphan Fund's annual meeting at Simpson's Restaurant, Strand. **THURSDAY, FEBRUARY 17:** Ipswich Gardeners' Association's meeting; Wallington Horticultural Society's lecture. **FRIDAY, FEBRUARY 18:** Manchester and North of England Orchid Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Luminous Fungi.*—As I was returning home, on foot, late in the evening in October last, I saw a light before me in a part of the road which an avenue of thick overhanging trees made particularly dark; I took it at first to be a lantern hung up against the side of a cart or waggon; but, on going up to the spot I found that the light came from a piece of half-decayed bark attached to the trunk of a tree, that was lying there on a timber carriage, that had been

FIG. 54.—BLACK CURRANT GALL MITES MIGRATING FROM UNSPRAYED "BIG BUD." (see p. 107).

Reproduced by permission from the *Annual Report* of the East Malling Research Station.

mission would be most grateful to any employer who can offer any of them employment. Many of these men have been employed by this Commission for some years and can be vouched for both as to qualifications and personal character. Some are married and some are single men, and come from all parts of the country. Prospective employers should apply to Capt Symons, Re-employment Committee, Imperial War Graves Commission, 82, Baker Street, London, W. 1.

**Bequests to Gardening Charities.**—The late Mr. Walter C. Slocock, of Goldworth Nurseries, Woking, left £244,398, and in addition to bequests to numerous employees and local charities, he left £250 to the Gardeners' Royal Benevolent Institution, and a similar amount to the sister charity, the Royal Gardeners' Orphan Fund.

**Appointments for the Ensuing Week.**—**MONDAY, FEBRUARY 14:** United Horticultural Benefit and Provident Society's meeting; Guildford and District Gardeners' Association's

meeting. The brightness was sufficient to have attracted my attention from a considerable distance. Some few days after this, my children, near the same spot, found a piece of luminous (inner) bark, which they brought home, and exhibited it in a dark corner of a room. The piece of bark was 2 or 3 feet long by some 10 inches in breadth, and from its whole surface a bright phosphorescent light was emitted. The appearance was very striking and beautiful. Many saw it, and all were equally struck with the phenomenon. It has a very strong fungus-like smell. In the course of a few days the moisture dried away, and with it, the peculiar smell and light disappeared. I have put some pieces of it into a mushroom house, with a hope of again exciting the growth of the Luminous Fungi.—J. D. Llewelyn, *Gard. Chron.* February 14, 1852.

**Publications Received.**—*Florida Wild Flowers*, by Mary Francis Baker; price 12/6 net.—*My Garden Comes of Age*, by Julia H. Cumins; price 12/6 net. Both published by Macmillan and Co., St. Martin's Lane, W.C.2.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Phaius.**—*P. grandifolius*, *P. Blumei*, *P. Wallichii* and the numerous hybrids of this family are sending up their flower spikes, and the roots may be given a little weak liquid manure occasionally. When the flowering period is over, and new growth commences, any necessary repotting may be done; similar compost to that advised for *Zygopetalums* will be suitable. When growth is complete, and during the plant's season of rest, only sufficient water should be given to keep the compost just moist. The plants should not be exposed to direct sunlight during their growing season, as their thin leaves are easily scorched.

**Zygopetalum.**—Such species as *Z. Mackayi*, *Z. crinitum*, *Z. Ballii* and others of this section which produce their flowers from the partially-made pseudo-bulbs, should be repotted, if necessary, as they pass out of flower. As the two former species produce large, succulent roots, they need rather large pots, which should be well-drained, as when in full growth the plants require an abundance of water. A mixture of fibrous loam, *Osmunda* fibre, peat fibre and *Sphagnum*-moss, in equal proportions, with sufficient broken crocks to render the compost porous, forms a suitable rooting-medium for all these species, and the hybrids derived from them. For the more delicate growers, the amount of loam fibre may be reduced. The newly-potted plants should be watered with extreme care, as an excess of moisture may mean the deterioration of the plants. The bi-generic hybrid, *Zygocolax*, which is the result of crossing *Colax jugosus* with different species and hybrids of *Zygopetalum*, succeeds under precisely the same conditions, but, being plants of a smaller nature, the pots in which they are grown should be in accordance with the size of the plants. Thrips are the greatest enemies of these Orchids and must be eradicated, as if they are allowed to disfigure the young foliage, the growths seldom recover from the check. *Colax jugosus* succeeds under the same conditions, but needs a humid atmosphere when in growth, with drier conditions when at rest.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WYRETHRE, Horsley Hall, Gresford, N. Wales.

**Jerusalem Artichoke.**—This vegetable is generally of inferior quality through being planted too thickly. Allow a space of three feet between the rows and not less than eighteen to twenty inches between the sets. Plant the tubers now in well-prepared ground, and choose the white variety in preference to the pink or purple kind.

**Rhubarb.**—The crowns of Rhubarb are now moving, and to ensure well-bleached stalks place either pots, barrels or deep boxes over them, and pack litter on and around the covers. Should the stalks be required quickly, fermenting material, consisting of manure and leaves mixed together and used in sufficient bulk, will give the necessary warmth to attain this result. The latter method has a weakening effect on the crowns and should not be practised annually with the same plants.

**Exhibition and Early Leeks.**—To obtain exhibition or early Leeks the seeds should be sown now, either in boxes or small pots, the latter for preference if the Leeks are required for exhibition, as by this means the plants receive no check in transplanting. Sow about four seeds in a three-inch pot and, when well-advanced leave only the best plant which, when sufficiently strong, may be placed in a larger receptacle without undue disturbance.

### PLANTS UNDER GLASS.

By T. PAYMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockton Hall, Hertfordshire.

**Clerodendron fallax.**—This plant may be propagated either from cuttings or seeds. The seeds should be sown now to produce good flowering plants for next autumn. Where a stock is raised from cuttings, the old flowering plants should be cut back slightly, stood in a moist atmosphere and syringed regularly. Shoots suitable for use as cuttings will soon be forthcoming, and they will root easily in a propagating frame. They should be taken when about three inches in length.

**Bouvardias.**—A young stock of these plants may be raised by placing some of the old plants that have been cut hard back in a warm, moist house. With frequent syringings they will soon break into growth, and, when the shoots are about three inches long, they may be used as cuttings, which will root readily if placed in a warm propagating frame. *Bouvardias*

of water supplemented by frequent applications of liquid manure. Large specimens that have been stored in a cool place to provide a succession of bloom should be examined occasionally, for when they show signs of activity they must not be allowed to become dry. *Hydrangeas* require a fairly rich compost, and where it is desired to obtain blue flowers the mixtures recommended for the purpose should be used in the early stages of growth in strict accordance with the makers' instructions.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Root-lifting.**—The lifting and root-pruning of unfruitful trees, the roots of which have grown downwards into the cold subsoil, may still be done. At this season it is better not to be too severe when carrying out this work. Young trees may be lifted entirely, but in the case of older and

FIG. 55.—BLACK CURRANT GALL MITE.

Shoot of Baldwin Black, showing the period at which lime-sulphur spray should be applied to the bushes. (see p. 107). Reproduced by permission from the *Annual Report* of the East Malling Research Station.

may also be raised by means of root-cuttings, and for this purpose some of the old plants should be shaken out, the stoutest roots cut into pieces some two or three inches long, and the pieces dibbled in sandy soil, either in pots or pans. The root-cuttings should be treated as recommended for growth cuttings, but some varieties propagated from root-cuttings do not come true to colour. Mite is sometimes troublesome to *Bouvardias* and should be eradicated by the use of Campbell's sulphur vaporiser.

**Hydrangea Hortensia.**—Plants that were propagated last autumn from strong, well-ripened shoots may now be started into growth with a reasonable chance of their flowering. When it is seen that the young growth is active they may be transferred to their flowering pots; forty-eight-sized pots may be used for the stronger plants, while fifty-four's will be suitable for those that have made less robust specimens. Careful watering is necessary at this stage, but when in full growth *Hydrangeas* require ample supplies

larger ones only half of the roots should be disturbed at this period, leaving the other half to be done next autumn.

**Arrears of Planting.**—In favourable weather endeavour to complete all arrears of planting. If the land is of a heavy texture scatter a few shovelfuls of dry earth amongst the roots and do not trample the soil too firmly, but leave the firming of the ground until the conditions are more favourable.

**Loganberries.**—There are many ways of growing and training the Loganberry, and considering how useful the fruits are and how much they are appreciated, the plants should be given every care and attention to produce the best results. This fruit is not at all particular as to the nature of the soil and the position in which it is grown. Loganberries may be planted and trained on wires, poles, fences, or old buildings, where the growths have plenty of room for extension. Remove a few inches of the surface soil and substitute fresh earth from another part of the garden.

**Grafting.**—Make preparations for any grafting that is to be done this spring; prepare the tree for the reception of the grafts later, but do not shorten the branches too severely. The selected branches on which the grafts are to be placed may range from two or more feet in length. All grafts should be labelled correctly and heeled in on a north border until the time for grafting arrives. In grafting trees that have been headed down the method known as cleft grafting is the most suitable.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P., Ford Manor, Lingfield, Surrey.

**Pears and Apples.**—These fruits are a great success under glass and produce fruits of enormous size and superb flavour. The impression prevails that they will not respond to fire-heat at any period of their growth, but this is hardly borne out by facts, as the finest fruits may be grown where the temperature ranges much higher than in the open, but they do fail when the soil is stagnant with moisture and an insufficient supply of fresh air is given them. A house in which one can feel fresh air moving will suit these fruits in average seasons, and once the pips are formed the development of the fruits may be hastened by closing the house early for a few hours on fine afternoons. The chief details in their successful management is gentle warmth from the pipes, liberal feeding and abundance of fresh air.

**Pot Vines.**—If the bunches were reduced to near the requisite number for the crop before they came into flower, and those retained have set their berries, the latter should be thinned without further delay. Do not pinch the laterals too drastically as the Grapes increase in growth, rather encourage leaf-development as it will help to improve the size and colour of the berries, always bearing in mind that good, healthy main leaves are preferable to surplus lateral growths. After the Grapes are thinned and swelling freely apply rich top-dressings of old turf, bone-meal and a suitable vine manure to the roots, and feed them also with weak liquid manure, as the soil in the pots will by this time be almost exhausted. Take advantage of sunny days to forward the crop, but do not let the night temperature exceed 63° to 65° on cold nights, and 65° to 70° on mild ones. Syringe all available spaces and keep the evaporating pans filled with diluted liquid manure, which should not be too strong or it will injure the delicate leaves. Ventilation will need careful attention to obviate giving the vines a check, and the small amount of air admitted at night should be discontinued in the morning to favour a rise in the temperature before the house is syringed. A little air may be admitted when the thermometer reaches 75°, and increased or reduced as the case may be until the temperature stands steady at 80°. Close the house in time to ensure a rise to 85° when atmospheric moisture, aided by gentle warmth from the pipes, will favour rapid development of the foliage and berries.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Aquilegias.**—The many fine strains of the long-spurred Aquilegia are ideal for furnishing beds and borders, as well as for supplying cut blooms. The finer strains require a long growing season to obtain good plants for setting out-of-doors during the autumn. Stand the seed-boxes in a greenhouse or cold frame, and when the seedlings are fit to handle, prick them out into shallow boxes. They should be grown on in cold frames until large enough, when they should be hardened off and planted in the reserve garden.

**Clematis.**—As these plants are showing signs of growth they should be pruned and made tidy. All the Jackmannii varieties which flower on the current year's shoots, may be cut back to within a few feet of the ground especially if they

are used to furnish walls or trellis work. If, however, they are trained into thin-growing trees—which is the ideal method of using the stronger-growing varieties—the pruning should not be so severe. Old Apple trees and the common Laburnum make excellent supports for Clematises, in fact, many other thin-growing trees may be made to serve this purpose. The varieties belonging to the lanuginosa and patens sections require different treatment, as they flower on shoots developed from the old wood. In their case, pruning usually consists in cutting out dead shoots and shortening the live ones where the plants have covered their allotted space; they require very careful handling as the shoots are very brittle and easily damaged. When planting Clematis, the sites should be prepared carefully, efficient drainage being essential. Well-decayed manure and old mortar rubble should be incorporated with the compost. The plants are usually purchased in pots, and in planting them the soil should be shaken from the thong-like roots so that the latter may be spread out when planting them. Although

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Pot Pelargoniums.**—Where a batch of Zonal Pelargoniums is wanted for next winter's display the cuttings should be inserted this month around the edges of pots in a sandy compost. The varieties grown are numerous, and many single as well as double sorts are available. So soon as these cuttings are rooted, they should be potted singly and grown on until the pots are comfortably filled with roots, when the plants should be moved into larger receptacles and grown under cool conditions. They should be transferred to their flowering pots during June and grown in frames during the summer, from which, in fine weather, the sashes may be removed, and the plants actually grown in the open air. All flowers should be regularly pinched off, and the leading growths stopped as necessary until September, when the plants will require to be taken indoors and given a sunny

FIG. 56.—BLACK CURRANT GALL MITES KILLED BY LIME-SULPHUR SPRAY.

(see p. 107).

Reproduced by permission from the *Annual Report of the East Malling Research Station.*

the heads should be exposed to the sun, it is essential that the roots have at least partial shade. Clematis montana and its varieties are spring-flowering plants and when it is desired to prune them it should be done immediately after they have finished flowering.

**Herbaceous Clematis.**—The herbaceous section of Clematis includes numbers of species and varieties which are very useful for furnishing lawn beds or grouping in the herbaceous border. C. heracleaefolia and its variety Davidiana are very useful for filling moderate-sized beds; there are also two beautiful hybrids of French origin, viz., Campanile and Oiseau Bleu, the former especially being very beautiful with its spire-like inflorescence of pale blue flowers. C. recta, C. integrifolia and the hybrid Hendersonii are all useful plants for the herbaceous border; the last requires some suitable support as it attains a height of eight to ten feet. The slender-growing and beautiful C. coccinea should be tied to a slender cane, and is best planted at the foot of a warm well.

position in a house having a temperature of 50° at night. A compost of loam, leaf-soil, sand, and a small quantity of bone-meal is all that they require, but when the pots are well-filled with roots the latter may be fed regularly with artificial or diluted liquid manure.

**Bedding Plants from Seeds.**—Large numbers of the plants used for bedding are raised annually from seeds, and the sowing of these in boxes under glass should be done early so that the seedlings may have time to become robust before planting time arrives. Among such plants, Antirrhinums are important, and they give a display of colour during the summer and autumn at little trouble and expense. Other plants include Lobelias, Ageratums and Begonias, especially the fibrous-rooted section, which include such beautiful sorts as Crimson Bedder and Fairy Queen, which may be treated as annuals with excellent results. Dahlias of various kinds, and many others of a like nature, if sown now, provide a range of bedding plants unknown to a former generation.

## ALPINE GARDEN.

## BELLIS ROTUNDIFOLIA COERULESCENS.

This very charming little Daisy is an admirable plant for a sunny ledge in the rock garden where the soil is free and gritty. It makes a neat rosette of its almost prostrate leaves, which are silvered with a grey down, and yields the summer through an unbroken succession of blossoms in a lovely shade of clear lavender-blue.

The flowers, like the foliage, are about the same size as those of our common field Daisy, and the plant is certainly not less prolific in flowering. Indeed, few choice rock garden subjects can be relied on to afford such a long season of blooming as *B. r. coerulescens*. Though it slowly makes an ever-widening clump, this Daisy does not "run" and become troublesome in that way. *J.*

## ERIGERON MUCRONATUS.

In many rock gardens *Erigeron mucronatus* becomes a weed, and where it succeeds must be kept from choking other plants with its seedlings. In other gardens, unless in a wall, it often succumbs in wet winters.

This *Erigeron* is of rather trailing habit and has pretty leaves on branches about nine inches or less in length which also bear a number of red and white, small, Daisy-like flowers.

*E. mucronatus* is easily raised from seeds, but may also be propagated by division or from cuttings. *S. A.*

## THE MASSING OF PLANTS IN ROCK GARDENS.

In planting alpine in large pockets it is necessary to consider a colour scheme and to make arrangements for a varied display over the whole of the season in the different parts of the rock garden. In some cases two plantings may be made in one season. Blue *Primulas* or other early flowers may be followed by *Cynoglossum amabile*, which blooms from August onwards.

Subjects specially suitable for massing are *Æthionema grandiflora* (twelve plants will make a fine group), *Gentianas*, *Geraniums*, *Anemone Hepatica*, *Lithospermum*, *Mertensia*, *Potentilla*, *Primula Juliae* and its variety *Gloria*; *Achilleas*, *Alliums* (with another subject) *Androsaces*, *Anemones*, *Arenarias*, *Armeria Vindictive*, *Aster alpinus*, *A. sub-coeruleus*, *Aubrietias*, *Calceolaria polyrhiza*, *Campanulas*, of which the variety *G. F. Wilson* is one of the best; *Cheiranthus Allionii*, *Cyclamens*, *Dianthus*, *Epimediums*, *Erinus*, *Iberis*, *Incarvilleas*, *Orchis foliosa*, *Enothera*, *Onosma*, *Pentstemon heterophyllus*, *Phlox subulata* in variety, *Plumbago Larpentae*, *Polygonum affine*, *Prunella Webbiana*, *Saponaria*, *Silene*, *Trollius*, *Veronica* and *Violas*.

It is advisable to keep all the encrusted *Saxifrages* in a collection, and they show to best advantage on a south or west slope with the larger sprays of flowers tumbling over the rocks, while the mossy varieties may be placed in other parts where they will have sufficient moisture and cool conditions.

*Sedums* may be associated with the encrusted type of *Saxifraga* in the drier parts of the rock garden and in places where few other plants would grow; another useful subject for this purpose is *Genista sagittalis*, which produces a mass of yellow flowers.

*Helianthemums*, planted with *Indigofera Gerardiana*, two feet to three feet apart, are very effective near a water-pool or stream. *Mimulus*, in these gardens, has survived the severest of winters, and, contrary to the usual practice, is planted on a fairly steep slope facing west.

If a bog garden is made in conjunction with an extensive rock garden it should be proportionately large, and it is well that it should be planted in breadths of colour. This may be provided by planting *Iris laevigata*, *Primulas*, *Spiraeas* (*Astilbes*), *Trollius Orange Globe*, *Ranunculus aconitifolia*, *Rodgersias*, *Orchis*, *Roscoea cauleoides*, *Ourisia coccinea*, *Cimicifuga simplex* and *Cardamine*. *A. J. Hartless, Kings Walden Bury Gardens, Hitchen.*

## FLOWER BORDER.

## CYNOGLOSSUM BLUE GEM.

It must be more than a decade since seeds of this biennial were offered for sale, yet, so far, the plant is not very generally grown. Those who appreciate a soft, saxe-blue colour should procure *Cynoglossum Blue Gem* to supply this pleasing tone in the garden throughout the month of June. When grown in the border, this Hound's Tongue must be renewed each year, as the plants die after flowering. *Cynoglossum Blue Gem* is not difficult to grow, yet there are a few cultural details which should be followed if good results are to follow.

To secure large plants, seeds should be sown thinly in the open border early in June and the young plants transferred to their flowering stations in October. Plants treated thus—when grown in good soil—will throw up from nine to twelve flowering stems, from eighteen inches to thirty inches high, which will commence to expand their numerous and dainty flowers early in June, and continue to make a display for several weeks. One might imagine that by sowing seeds in August, a batch of plants could be secured for a later display the following year, but there is not the slightest difference in regard to flowering between the plants raised in June and those raised in August; but, there is a decided difference in the height and number of flower stems, as the late-raised plants produce one flower stem each, which attains to only half the height of those sent up by the June batch. *D. A., Midlothian.*

## ANTIRRHINUMS.

THE many beautiful varieties of *Antirrhinum* are easily raised from seeds sown at this time; the seeds should be scattered thinly in boxes, and will germinate quickly in a warm greenhouse.

When fit to handle, the seedlings should be pricked off into boxes, and in a few days they may be transferred to cold frames. When they are about three inches in height they should be hardened off and planted out in the nursery garden. When lining them out, place a sprinkling of flaky leaf-soil about the roots; they may then be lifted with good balls when required. Lack of space has compelled me to adopt this method, and with reasonable care I find that they transplant perfectly, even when coming into flower.

Plants that were raised during the autumn for blooming early should be hardened off for planting out next month.

## EAST LOTHIAN STOCKS.

THESE Stocks are very useful for bedding purposes, and the seeds should be sown without delay, taking care to sow them thinly, as the seedlings are very liable to damp off if crowded. For the same reason they should be pricked off before they are crowded in the seed boxes. *J. Coult.*

## WOODLAND GARDEN.

## SAXIFRAGA GRANULATA.

THE meadow *Saxifrage* is a native plant that is worthy of more attention from the gardener than it at present receives. It succeeds well in almost any position, damp or dry, in sun or in shade, and even under woodland conditions it flowers profusely. As a subject for the rock garden it is not by any means to be despised.

The pure white, slightly drooping flowers are produced on erect, branched stems, six to eighteen inches in length. They are about one inch in diameter and are borne several on a stem in April or May. Propagation is most easily effected by division of the root-stock, which is composed of a cluster of tiny tubers that root freely around the parent plant.

A double variety, known as *S. granulata* flore pleno, is often met with under cultivation but although the flowers of this last longer, it has not, in my estimation, the dainty charm of the type. *T. H. Everett.*

## TREES AND SHRUBS.

## RHODODENDRON DAURICUM.

THE Dahurian *Rhododendron* is a native of Siberia and is the earliest species to open its flowers: these are of a bright rosy-purple hue, and appear in January and February, often when the ground is covered with a mantle of white.

*R. dauricum* forms a somewhat upright shrub, five or six feet in height, and the shoots are clothed with glossy green, rounded leaves.

The plants vary a good deal in the extent to which they retain their leaves through the winter, some being quite deciduous and others semi-evergreen. A variety known as *sempervirens* has this evergreen character most pronounced and the flowers are usually of a somewhat deeper colour than those of the type; they are rather saucer-shaped, and about one-and-a-half inch in diameter.

Although hardy, it is advisable to give this *Rhododendron* as sheltered a position as possible in order that the flowers may not be unduly exposed to inclement winter weather. Planted to form a small group, it forms a charming feature when little else is in bloom in the open garden. *T. H. Everett.*

## PRUNUS MICROLEPIS.

IN 1916, we received a plant of this *Prunus*, and since then it has grown into a fine, bushy tree about five feet high and about as much through. At the present time it is covered with a mass of its semi-double, drooping flowers, of a pale pink shade, which develop on twiggy, horizontal branches, making a very light and pleasing display when seen in suitable light with the darker foliage behind them. The tree commenced flowering before the leaves had fallen, and at Christmas it was full of flower, and the subject of enquiry by all who visited the garden at that time. Last winter it was in flower from November to April, there being flowers amongst the young foliage.

I find the blossoms open quite as well after 10° of frost as during milder weather. The moistness of our climate here seems more detrimental to the flowers than cold. The flower buds open well in the dwelling-house and remain fresh for a long time, and are thus valuable for decoration as cut sprays in winter. *R. W. Norman, Treliassick Gardens, Truro.*

## PHILESIA BUXIFOLIA.

THIS remarkable shrub never fails to appeal to those who have a special regard for rare and interesting plants. It is a native of Chile and was introduced in 1847; it belongs to the *Liliaceae*, but at first glance its foliage rather suggests a Yew. It makes tough, red-brown, woody stems of about one foot in height; the short branches of these are rather sparsely furnished with alternate, deep green leaves of a leathery texture, with glaucous undersurface. The leaves are an inch or more in length, about two-eighths-of-an-inch in width, and sharply pointed. In curious contrast to the rather dull foliage are the tubular flowers, which are fully two inches in length and of a rich crimson, very much like those of *Lapageria*.

In my garden, *P. buxifolia* is tolerably content with a bed of leaf-mould and gritty loam in a cool, partly-shaded spot. It spreads slowly by running underground, sending up spear-like shoots which suggest those of a *Ruscus*. The plant appears to be quite reasonably hardy, and is often exposed here to 15° of frost without injury.

The late Mr. E. C. Buxton grew this plant well in his garden at Bettws-y-Coed. The bed was almost entirely composed of peat, and it was situated on the north side of a large Yew, only getting sun in full summer, and that for a brief space in the evening. The ground being rather dry, water was copiously supplied during the growing season.

*P. buxifolia* may be increased by division; portions taken with a good mass of soil transplant very successfully. *A. T. Johnson, Ro Wen, Conway, N. Wales.*

# CARTERS *for* GLADIOLI

## FOR AUTUMN FLOWERING

Gladioli Giant White  
The largest white variety grown

	Per doz.	Per 100
<b>Duchess of York.</b> Bright plum purple, deep markings	2/9	21/-
<b>Jacoba Van Beyera.</b> Claret mauve ...	4/6	33/-
<b>Meilust.</b> Rose pink with cerise blotch...	2/9	21/-
<b>Rose Précoce.</b> Soft rose, with deeper carmine rose throat ...	5/6	42/-
<b>Venus.</b> Pale blush, slight pink suffusing, sulphur blotch at throat ...	2/3	16/9
<b>Crimson Glow.</b> Crimson scarlet, powdered sulphur at throat ...	4/-	30/-

	Per doz.	Per 100
<b>Prince of Wales.</b> Pale Salmon ...	2/-	15/-
<b>Mrs. K. Velthuys.</b> Bright velvety crimson ...	4/6	33/-
<b>Red Emperor.</b> Intense scarlet, flaked crimson ...	2/3	16/9
<b>White Giant.</b> Largest white variety grown ( <i>See Illus.</i> )...	2/6	18/9
<b>Vesta Tilley.</b> Very fine creamy - white variety; beautiful cerise throat ...	3/-	22/6
<b>Willy Wigman.</b> Delicate cream, dark red blotch ...	2/-	15/-
<b>Yellow Hammer.</b> Clear yellow ...	2/3	16/9

## BEGONIAS Awarded 95 Gold Medals

In superb quality and extra large tubers for Greenhouse or Bedding

Doubles, in 8 colours, flowers like large Roses and Camellias	6/- per doz.	42/- per 100
" in mixed colours	5/- "	35/- "
Singles, in 6 colours, very large fine shaped flowers	4/6 "	30/- "
" in mixed colours	3/6 "	24/- "
" Frilled or Crested, in 6 colours	5/- "	35/- "
" " in mixed colours	4/- "	28/- "

Collection of 36 large tubers - 12 Doubles, 12 Singles, 12 Frilled Singles - 14/-.

Collections of 12 named hanging basket Begonias, 3 each 4 sorts, 50/- & 35/-. Excellent value.

Post Free on orders of 10/- and over.

Send for FREE Catalogue of Named Double Begonias for Exhibition, Basket varieties, Cyclamen, Gloxinias, Polyanthus, Herbaceous Plants, etc.

## DELPHINIUMS Awarded 5 Gold Medals

17 Awards of Merit at R.H.S. Delphinium Trials at Wisley in 1925

Plant NOW. We have pleasure in offering the following Collections which are specially good value in strong ground roots, which will make a fine show of bloom this year.

Collection A, 12 extra good sorts	70/-	Collection C, 12 fine sorts	30/-
" B, 12 very choice sorts	42/-	" D, 12 good sorts	22/-
Collection E, 12 average sorts	15/-		

**PHLOX DECUSSATA** A selection of the best and latest sorts, 9/- per doz.

For Descriptive Catalogue, apply

Indispensable in the Garden

## THOMSON'S MANURES

On the market for over 50 years, they still hold first place for QUALITY and RESULTS. They are safe, sure and lasting. The direct result of many years' practical experience in gardening, they stand unrivalled at the present day for all Garden Crops.

Prices:—VINE, PLANT AND VEGETABLE MANURE—a Perfect Food—1 cwt., 30/-; 56 lb. 16/-; 28 lb. 9/-; 14 lb. 5/-; 7 lb. 3/-; tins 1/3 and 9d.  
SPECIAL TOP DRESSING MANURE—an excellent stimulant—56 lb. 17/-; 28 lb. 9/6; 14 lb. 5/6; 7 lb. 3/-; tins 1/3; Carriage paid on 28 lbs. and up.

WRITE FOR OUR BOOKLET—POST FREE ON REQUEST  
SOLD BY NURSERYMEN AND SEEDSMEN EVERYWHERE.

Or from Sole Makers, WM. THOMSON & SONS, Ltd. TWEED VINEYARDS, CLOVENFORDS, SCOTLAND.

## LAWN SAND

To destroy Clover and Weeds in Lawns, apply Lawn Sand. Use at the rate of 4 ozs. to the square yard. 1 cwt. is sufficient for a Tennis Lawn.

PRICE PER CWT. 35/- IN KEGS. CARR. PAID.

14 lbs. 7/6; 28 lbs. 12/6; 56 lbs. 20/-

## LAWN GUANO

Turf that has to stand hard wear requires a carefully balanced Fertilizer. Fisons' Lawn Guano is used by many of the leading Tennis Clubs.

PRICE PER CWT. 33/- CARR. PAID.

7 lbs. 4/-; 14 lbs. 7/-; 28 lbs. 11/-; 56 lbs. 18/-.

Illustrated Catalogue of Fertilizers for all crops post free from the manufacturers.

## The World's Finest Strains of Florist Flowers

**CYCLAMEN** — Giant Salmon, clear rich salmon; under artificial light the effect is delightful. 2/6 pkt.

— Giant Scarlet, a superb colour. 2/6 & 5/- pkt.

— Giant Pink, clear salmon-pink. 2/6 pkt.

— Giant White, the largest flower of all; snowy white. 2/6 pkt.

— Giant White, rose base 2/6 pkt.

— Giant Choicest Mixed. 1/6 & 2/6 pkt.

**GLOXINIA** — Clibrans' Giant - Flowered Hybrids. Our famous "Gold Medal" strain, saved only from the largest blooms of purest and richest colours, of robust habit, flowers erect on stout stems. Choicest Mixed. 1/6 & 2/6 pkt.

— Clibrans' Giant Crimson-Scarlet, White, Scarlet, Scarlet and White, Purple, Rose, Pink and White, Blue and White, separate, each, 2/6 pkt.

**SCHIZANTHUS** — Clibrans' Giant-Flowered, A.M., R.H.S.: About 3 ft. in height, with an abundance of richly coloured, magnificently blotched flowers in a wide range of colours. 2/6 & 5/- pkt.

**STREPTOCARPUS** — Clibrans' Giant Hybrids. Vigorous growing, free blooming, large, from purest white through a variety of shades to red and purple. Some are beautifully marked in the throat, whilst others are practically self colours. Choicest Mixed, 1/6 & 2/6 pkt.

— Blue, Blush, Mauve, Pink, Red, Rose, White, separate, each, 2/6 pkt.

**CALCEOLARIA** — Herbaceous, Clibrans' "Gold Medal" Strain, of dwarf, strong, healthy, sturdy habit, with enormous flowers of rich and varied colours.

Choicest mixed, 1/6 & 2/6 pkt.

**CINERARIA** — Clibrans' Giant - Flowered "Gold Medal" Strain.

Mixed, all colours, 1/6 & 2/6 pkt.

— Giant-Flowered Blue, rich blue shades. 1/6 & 2/6 pkt.

— Giant-Flowered Crimson, brilliant crimson shades. 1/6 & 2/6 pkt.

— Giant - Flowered Pink, a lovely shade. 1/6 & 2/6 pkt.

— Giant-Flowered Rose, charming shade of old rose. 1/6 & 2/6 pkt.

— Giant-Flowered White, purest white, extra fine. 1/6 & 2/6 pkt.

**CYCLAMEN** — Clibrans' Giant Crimson, a magnificent flower of an intense deep crimson colour. 2/6 pkt.

## INDOOR PLANTS.

## PANAX.

PANAX *Victorice* and P. *Balfouri* are the most commonly cultivated species of the two distinct types of this genus of ornamental foliaged shrubs.

P. *Victorice* is an old, one-time-popular stove plant of graceful habit, forming a neat, dense bush of finely variegated, white and green foliage. P. *Balfouri* is stiffer in appearance. The undivided, orbicular leaves are deep green, margined with white, and three inches or four inches in diameter.

These plants thrive under ordinary stove treatment, requiring heat and moisture during the growing season, but cooler and drier conditions when at rest.

Bottom heat is essential for their successful propagation, which may be effected from root-cuttings, portions of the stem, the sucker-like growths from the base of old plants, or half-ripened shoots taken when a few inches long. F.

## GESNERAS.

GESNERAS are among the most beautiful of our decorative indoor plants, for they have very beautiful flowers and beautifully-marked foliage.

Seeds should be sown from January to March in well-drained pans, containing a porous compost of fibrous loam and leaf-mould, mixed with equal parts of peat and silver-sand. Fill the pans to within half-an-inch of the top and soak the soil thoroughly before sowing the seeds. Sow thinly and cover the seeds lightly with fine silver-sand. Place the seed-pans in a temperature of from 60° to 70° and arrange a sheet of glass over the pans, keeping the soil well shaded from bright sunshine until the seeds have germinated. When the seedlings are large enough to handle, prick them off into pans or boxes containing a similar compost. Keep the atmosphere close for a few days until the plants are re-established. When the seedlings have made from two to three pairs of leaves shift them into sixty-sized pots and return them to their former position, placing them as near the roof-glass as possible, but free from cold draughts. Keep the plants shaded from direct sunshine, as the foliage at this stage is very tender and easily scorched.

Having become well-established in these pots, transfer them to six-inch or seven-inch pots, in which they will flower. The compost for this potting should consist of equal proportions of fibrous loam, peat and silver-sand, to which may be added a little finely-broken cow manure. After potting them, place the plants in a house having a temperature of 60° to 65°, on a bed of moist ashes. On no account use the syringe for Gesneras, as water in nearly all cases contains lime in solution and this, if allowed to deposit on the foliage, would greatly disfigure the plants. When the stems have attained from five inches to six inches in height, they should be staked neatly, as the fleshy leaves are liable to snap off down to the level of the pots. When the plants are well-established give the roots weak liquid manure about once a fortnight, but take great care not to overdo this as Gesneras do not respond to liberal feeding. When the flowers show signs of expanding, grow the plants in a slightly lower temperature to prolong the season of flowering. When blooming is over, gradually withhold water until the foliage dies down. Place the pots on their sides under the plant stages in a cool house until they are required for starting into growth again. Having been sufficiently rested, they may be shaken out of their pots and grown on in the same way as recommended for seedlings.

By starting successional batches of corms, Gesneras may be had in flower practically all the year round.

Thrips are frequently troublesome and should be destroyed by fumigating the house. Mealy bug may be kept in check by using a stiff camel-hair brush dipped in methylated spirit, applying this specific to the infested parts. Sponging is not to be recommended as the foliage is easily broken. E. Baker, Garston Manor Gardens, Near Watford, Hertfordshire.

## ORCHID NOTES AND GLEANINGS.

CALADENIA FILAMENTOSA (R. Br.)  
(SYN. C. FILIFERA, LINDL. AND C. DENTICULATA, LINDL.)

CALADENIA FILAMENTOSA (Fig. 57) is a very quaint spider-like, terrestrial Orchid, with deeply-coloured, very attenuated segments to its blossoms. It is fairly common in damp soils beneath

FIG. 57.—CALADENIA FILAMENTOSA.

the shade of sparse-leaved, evergreen trees in the "thin" forest regions of New South Wales, Victoria, South Australia, Western Australia and Tasmania. The districts which it inhabits are much like our park lands, consisting of fully-developed trees, thinly scattered over undulating grassy country, therefore this plant is not a lover of dense shade. In its native country it commences to blossom in December.

The root-system consists of a stout white underground stem, about two inches in length, terminating in two tubers about the size and shape of the kernel of a Hazel-nut. The larger tuber supplies the nourishment for the growing

plant and shrivels after the seeds have ripened, the other tuber eventually produces next year's plant, although at times it lies dormant in the soil for two years, thus accounting for its abundance one season and paucity or even total absence the next in its native habitats.

The leaf which springs from the base of the stem at soil level exactly resembles a blade of grass; it is from three to five inches long and about an eighth-of-an-inch in width; its edges are fringed with long, spreading hairs; in colour it is pale yellowish-green, shaded with purple towards its base. The slender, red-tinted, flexuous flower stem is from six to nine inches tall, and is clothed with long, spreading hairs; there is a narrowly linear bract about one inch long near the middle of the flower stem and one at the base of each flower stalk.

The blossoms are one or two, rarely three, in number, and are widely separated on the stem; their segments, spreading out like the rays of a star-fish, are well over three inches across. The petals and sepals are about equal in length, very narrowly linear in shape, tapering towards the apex, where they are blunt; they vary in colour from deep crimson to dark reddish-brown, and the backs of the sepals are covered with short, glandular hairs. The white, crimson-striped lip is about half-an-inch in length, three-lobed; the centre lobe is long, pointed, and curves under; the side lobes are upright and bluntly-toothed; there is a double row of tooth-like processes down its centre, which, like the sticky, glandular hairs on the back of the sepals and on the bract at the base of the ovary, offer an almost impassable barrier to the crawling, but not to the winged, insect, for whom the plant secretes the nectar in the base of the flower and relies on for the cross fertilisation of its blossoms.

Like so many terrestrial Orchids of the temperate regions of the southern hemisphere this species of Caladenia is somewhat difficult to cultivate in this country, owing mainly to its being in full growth when the damp, foggy, sunless months are with us. The tubers should be planted about two inches below the surface, in pots or pans containing sandy loam and leaf-soil; the drainage should be ample and the plants should be plentifully supplied with water when in full growth, and sufficient to keep the tubers from shrivelling when dormant. They are best grown in a greenhouse from which the frost is excluded, where they may receive all the light possible, although it is found in the mountainous districts of Victoria and Tasmania at sufficient elevation to ensure the perfect hardiness in the south of England of plants collected in these districts. A. W. D.

## HARDY FLOWER BORDER.

## STOKESIA CYANEA PURPUREA.

THIS effective hardy perennial is of American origin; it is in bloom from June to October. The plant is of a neat, bushy habit, and attains a height of one-and-a-half foot to two feet. It produces an abundance of large, Aster-like flowers, fully three inches to four inches across, of a shade of delicate lavender-purple. The inflorescences are invaluable for use as cut flowers.

## BAPTISIA AUSTRALIS.

THIS is another valuable, blue-flowering perennial of American origin, producing pretty blue, Pea-shaped flowers in long racemes from June to August, on stout stems. It is a handsome foliage plant of dense, bushy habit.

## VERONICA LONGIFOLIA SUBSESSILIS.

THIS Veronica should be included in all collections of border flowers, for it is in bloom from July to September. The long, dense spikes of deep blue flowers are extremely effective in beds or borders. This Veronica grows two feet high, and the spikes are splendid for cutting. W. Logan.

**EDITORIAL NOTICES.**

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**SOIL PHYSICS.**

**I**N spite of the fact that much life service is devoted to cultivation (and the word implies a physical process) it is doubtful whether sufficient importance is generally attributed to the physical properties of the soil. While it is true that without the necessary chemical elements no soil can be fertile, it is also true that a large proportion of soils are infertile, not from the absence or scarceness of some vital chemical element, but because of neglect of physical laws. Arising out of a faulty diagnosis, many cultivators show a disposition to apply as a standard remedy for unproductiveness larger and larger doses of manures and even if this is effective it may be uneconomical. Scientific production entails the full utilisation of all the resources of the soil and available manures, and to do this an exhaustive study of the physical not less than the chemical problems, is essential.

In this article it is proposed to attempt in a few directions the correlation of principles and practice in the hope that thoughtful young gardeners with a scientific trend of mind may be stimulated to investigation. The great need of horticulture is applied science. Not until the army of scientific observers and recorders is multiplied many times can we hope to approach the ideal of complete scientific control of horticultural production. It is up to every young gardener with pride in his profession to make some contribution to this end. One of the most important of physical processes in the soil is connected with the supply of water. This affects the gardener in two ways—the supply of water as a raw material and the drainage of its excess. It is a truism that plants, like human beings, cannot live without water, nevertheless we know that vegetation is sustained through long periods of drought without visible access to a water supply. The truth is that soil which appears "bone dry" has still a large water content.

The holding capacity of soils for moisture varies with each kind of soil and may be referred to as the specific absorption factor. Soils rich in humus have the highest absorption factor, sandy soils the lowest. A pure sand has practically no absorption factor and is, therefore, incapable of supporting vegetation, as witness

the sterility of such wastes as the Sahara. Many sandy wastes have been made fertile by the incorporation and decay of organic matter, and much more could be done in this direction. It is within the power of every gardener to increase the absorptive power of his own soil by similar means. Absorptive power is not, however, the only factor in the conservation of moisture. There is a loss of moisture from evaporation and drainage as well as in supplying the needs of the plant. Rapid drainage is essential to fertility, hence control is limited to restricting evaporation. This may be done in two ways—by loosening the surface and by mulching. When the soil is fully charged with water it swells, and as the moisture is discharged the reverse process of contraction takes place, forming fissures in the soil. In firm, heavy soils these fissures sometimes assume the form of large cracks up to an inch in width; in other soils they are barely visible to the naked eye, but in all cases evaporation is tremendously increased. Hoeing or otherwise loosening the surface breaks up the fissures and interposes a loose layer offering a physical bar to evaporation. Mulching achieves the same end by a different method. It has been assumed that a growing layer of weeds takes the place of a mulch; this is a fallacy, because the weeds themselves rob the plants of available moisture.

The drainage of excess water from the soil has a great effect on fertility. Every cottage gardener knows that a plant will not grow in a watertight receptacle, hence the provision of an outlet in the common garden pot. The main reason is that stagnant water effectually prevents the access of air which plays a very important part in the many chemical reactions necessary to fertility. Where there is good drainage air follows the water by mechanical suction. On the large scale there is no exact counterpart to the watertight receptacle, but bad drainage will always reduce fertility in proportion to its imperfection. There are several practical ways of improving drainage in soils, besides the obvious ones of digging ditches and laying drain pipes under the surface. Laying the ground in ridges or "lands," deep cultivation, and the incorporation of decayed organic matter, all play their part. Stones are also useful in this respect, and their wholesale removal is to be deprecated.

Another highly important physical property of the soil is its temperature, which will depend on a variety of causes, such as specific heat, absorption of heat, radiation, conduction and evaporation.

The specific heat of a body is the number of thermal units required to raise a unit weight of the body through 1° of temperature, compared with the standard substance water. Water, with one exception, has the highest specific heat of any known substance, hence, soils with a high capacity for absorption of water have also a high specific heat. There are both advantages and disadvantages in the possession of this property. A very high specific heat renders the soil slow to acquire the minimum temperature necessary for germination and propagation in the spring, though it ensures the equable temperature so beneficial to steady growth over an extended period. The gardener's aim is a soil where both specific heat and absorptive capacity for moisture are at the optimum, and it seems that this ideal is most nearly approached in the case of a well drained, well-tilled soil, rich in humus. Rapidity of absorption of heat, which must not be confused with rise in temperature, is a very important factor in fertility. The effects of the slope of the land and of the presence of natural or artificial barriers serving as shelter from cold winds and as a reflective background for the sun's rays are well-known. The effect of the colour of the soil itself is less frequently considered. Black soils, however, absorb heat much more rapidly than soils light in colour, and the degree of blackness is a fair index of rapidity of absorption. This accounts, in part, for the value of soot as a surface dressing, and for the traditional reputation of black soils for fertility and early maturation of crops. The reverse process of radiation takes place more rapidly

from dark soils, but absorption and radiation are not proportional, and the net advantage is always with the black soil. The effect of a surface dressing of lime is to reduce absorptive power and, where immediate warmth is required, as on a south border in spring, it is worth while nullifying this effect by forking the lime below the surface.

Other possible ways of losing heat from the soil are by conduction and evaporation. A well-tilled soil, the interstices of which are filled with air, is practically a non-conductor of heat, but hard soils, impervious to air, have some conductive power. Evaporation, since it results in the removal of a body of higher thermal capacity, is one of the most patent sources of loss of heat. This affords another reason for the prevention, by the methods previously described, of loss of moisture by this means.

Although the thermal contents of the soil are mainly derived from an outside source—the sun, the effects of internal decomposition in the soil is not negligible. Most chemical reactions take place with evolution of heat the simplest example in the garden being the hot-bed. The same chemical reaction will always produce the same amount of heat, whether the reaction takes place slowly or quickly; but, of course, the rise in temperature is not always the same through many causes which produce variable dissipation of heat. Solution, like evaporation, when unaccompanied by chemical reaction invariably results in absorption of heat. Hence, it is theoretically true that soluble manures, such as nitrate of soda, make the ground colder, but the effect of a light dressing on such a relatively large bulk must be infinitesimal.

The soil is the physical medium in which all the chemical reactions take place that result in the production of the crop, and it is inevitable that the physical nature of this medium will have a great effect on the quality and quantity of the crop. In the laboratory nearly all reactions take place in solution—generally aqueous solution.

The root hairs provide the sole channel for absorption of food into the plant. The physical problem which presents itself to every gardener is that of bringing the two—root hairs and plant food—into contact. Nearly all the processes of culture have this as their main object.

It is obvious that the amount of food capable of being absorbed will vary with the number of root-hairs. This explains why so many types and varieties of plants flourish in reputedly poor soils. It is often solely a question of the development of root systems. By this means a plant may be enabled to extract from a given area the food that other processes do not bring to the door of those varieties which refuse to grow except in rich soils. It is probable that roots cannot function and flourish in regions where air does not penetrate, hence the added importance of drainage, deep digging, hoeing and frequent stirring of the soil. The soil must be imagined as having a structure similar to a sponge with innumerable tiny channels for the circulation of air and moisture. It is essential that the soil should have both firmness and a certain amount of resilience, otherwise, when compressed, the spaces are squeezed out, and it becomes an impervious lump. This happens especially to clayey soils when worked in wet weather, and explains why heavy tractor ploughs have been found to reduce fertility in some cases. The incorporation of decayed organic manure is a remedy for this plasticity.

The benefits of exposure of soil to frost and weather changes have long been recognised. When frozen, the water in the soil expands and forces even the most rock-like or clayey soils into fine particles. This process is facilitated by ridging to expose a greater surface. At the same time, this procedure produces aeration, which is always beneficial. Hence the desirability of leaving the surface rough in all cases when not immediately required for planting.

Although stones represent, theoretically, so

much waste of space in the soil, they nevertheless serve their purpose in soil economics. They may be compared to the pavement in the street. It is probable they assist in preserving the right of way for water and air passage and in giving resiliency to the soil.

Whatever may be the precise method of the absorption of food into the plant, it is of the highest importance that the physical condition of the soil shall be such as to favour absorption by the roots.

The advantage in supplying manure in soluble form is that it becomes immediately available to the plant, and under favourable conditions may become fully absorbed by the plant. The disadvantage is that there is always a danger of soluble matter being lost in the drainage water. To avoid the risk of this, so far as possible, certain soluble manures, such as nitrate of soda, should only be applied to growing crops.

## SPECIAL PLANTS FOR LARGE BEDS.

As a change from what are known as summer bedding plants, there are not a few fine perennials equally as effective and with long-flowering qualities, that look exceedingly well in large beds.

In fact, when removed from the many species and varieties that usually go to the making of a hardy herbaceous border they impress their individuality with greater force, and when used in the mass give pleasing and often surprising effects. No tender bedding plant or annual can provide a display so effective as some of our finest perennials.

*Hesperis matronalis plena* (Fig. 58) is one of the best of such plants. It has been for centuries a much-prized garden favourite, and nowhere looks more effective than when massed in a large bed. It is not difficult to grow when once

plants under glass and providing ideal condition<sup>8</sup> for ripening the seed capsules but with no success.

*Malva Alcea* var. *fastigata* is also worthy of a large bed to itself. It is a splendid species and for this purpose superior to the more popular *Lavatera Olbia*. *M. Alcea* is perfectly hardy and provides a showy bed for many weeks; the flowers are a delicate shade of pale rose. It may be raised from seeds while cuttings rooted in a cold frame during the summer make fine plants for the following year. This *Malva* is far less grown than it deserves to be.

*Salvia dichroa* only received the R.H.S. Award of Merit a year ago, but has long been grown in our gardens. A native of the Atlas Mountains, it is not perfectly hardy, but in the south it is rarely killed by frost. A well-filled bed of this *Salvia* is a very striking object. I remember seeing this *Salvia* at Tongwood Gardens, Hawkhurst, in 1914, in magnificent form, six feet in height, as effective as a Del-

FIG. 58.—BED OF THE DOUBLE ROCKET, *HESPERIS MATRONALIS PLENA* IN HYDE PARK.

On the other hand, it is essential that insoluble manures that have to be absorbed by physical contact with the roots shall be in a finely-divided state, as, for example, basic slag, particularly when applied as a top-dressing. An exception may be made where solid matter can be placed in a position directly accessible to the roots, as, for example, quarter-inch bones in the bottom of pots or beneath the roots in a vine border.

The point that seems to be emphasised in the consideration of these physical principles is the importance of humus or decayed organic matter.

In the absorption and conservation of heat and moisture, in facilitating drainage, in providing that physical resilient texture invaluable to root-action and the passage of solvent matter, the substance we call humus plays a predominant physical part which has partly escaped recognition. All those who aim at the highest economic production must see that every possible step is taken to provide the best physical medium for the growth of crops without which much of the money spent on purely fertilising material is wasted. W. Auton.

its cultivation is understood. The passion for tidiness goes some way to account for its scarcity. The cutting down of the flower stems immediately after the flowers have faded is a ruinous procedure and usually results in the death of the plant. If these old stems are allowed to remain until growth again commences at the base, success is certain.

The purple form is a less satisfactory plant, at least, in town gardens, and the delightful lilac form shown at the R.H.S. Hall, from Aldenham, some years ago, cannot be obtained in quantity. The old plant catalogues of sixty years ago mention a red variety, but this has apparently disappeared.

*Veronica longifolia* var. *subsessilis* is another first-rate subject for a large bed. It is the finest of all the herbaceous species. It is not over hardy, being a native of the warmer parts of Japan. It has the advantage of being one of these plants that may be moved at any time without any ill effect. I have used it to replace late Tulips with great success. During hard weather a covering of dry leaves makes the plant quite safe. For some reason this species does not produce seeds in this country. I have made two attempts at seed saving, growing the

phinium and flowering well into the autumn. The plant revels in rich, rather heavy soil, and should be well fed. It seeds freely and is quite an easy plant.

The better-known *Salvia virgata nemorosa* is another splendid plant for an isolated bed. It is of the easiest culture and now well-known.

*Helenium Crimson Beauty*, raised by the late Mr. Jackman, at Woking, is a very fine plant, now coming into favour. It makes a fine bed, is a first-rate town plant, and, if given good soil and full sun, will last in beauty the whole season.

Masses of Phloxes and Delphiniums are now common features in many public parks and private gardens. Their one fault is that their period of effectiveness is short.

*Aster Thompsonii* is one of the very best plants for use in this way. Last summer, while I was visiting the Marine Parks, South Shields, a huge border of this *Aster* was a great surprise to me. It has always been considered a slow grower and scarce, but here was a border of nearly two thousand plants which were a mass of flower from early July until destroyed by frost. None of the modern, garden-raised *Michaelmas Daisies* can compare with this fine species in this respect. P. S.

**EDITORIAL NOTICES.**

**ADVERTISEMENTS** should be sent to the **PUBLISHERS**, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS**, 5 Tavistock Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**SOIL PHYSICS.**

**I**N spite of the fact that much life service is devoted to cultivation (and the word implies a physical process) it is doubtful whether sufficient importance is generally attributed to the physical properties of the soil. While it is true that without the necessary chemical elements no soil can be fertile, it is also true that a large proportion of soils are infertile, not from the absence or scarceness of some vital chemical element, but because of neglect of physical laws. Arising out of a faulty diagnosis, many cultivators show a disposition to apply as a standard remedy for unproductiveness larger and larger doses of manures and even if this is effective it may be uneconomical. Scientific production entails the full utilisation of all the resources of the soil and available manures, and to do this an exhaustive study of the physical not less than the chemical problems, is essential.

In this article it is proposed to attempt in a few directions the correlation of principles and practice in the hope that thoughtful young gardeners with a scientific trend of mind may be stimulated to investigation. The great need of horticulture is applied science. Not until the army of scientific observers and recorders is multiplied many times can we hope to approach the ideal of complete scientific control of horticultural production. It is up to every young gardener with pride in his profession to make some contribution to this end. One of the most important of physical processes in the soil is connected with the supply of water. This affects the gardener in two ways—the supply of water as a raw material and the drainage of its excess. It is a truism that plants, like human beings, cannot live without water, nevertheless we know that vegetation is sustained through long periods of drought without visible access to a water supply. The truth is that soil which appears "bone dry" has still a large water content.

The holding capacity of soils for moisture varies with each kind of soil and may be referred to as the specific absorption factor. Soils rich in humus have the highest absorption factor, sandy soils the lowest. A pure sand has practically no absorption factor and is, therefore, incapable of supporting vegetation, as witness

the sterility of such wastes as the Sahara. Many sandy wastes have been made fertile by the incorporation and decay of organic matter, and much more could be done in this direction. It is within the power of every gardener to increase the absorptive power of his own soil by similar means. Absorptive power is not, however, the only factor in the conservation of moisture. There is a loss of moisture from evaporation and drainage as well as in supplying the needs of the plant. Rapid drainage is essential to fertility, hence control is limited to restricting evaporation. This may be done in two ways—by loosening the surface and by mulching. When the soil is fully charged with water it swells, and as the moisture is discharged the reverse process of contraction takes place, forming fissures in the soil. In firm, heavy soils these fissures sometimes assume the form of large cracks up to an inch in width; in other soils they are barely visible to the naked eye, but in all cases evaporation is tremendously increased. Hoeing or otherwise loosening the surface breaks up the fissures and interposes a loose layer offering a physical bar to evaporation. Mulching achieves the same end by a different method. It has been assumed that a growing layer of weeds takes the place of a mulch; this is a fallacy, because the weeds themselves rob the plants of available moisture.

The drainage of excess water from the soil has a great effect on fertility. Every cottage gardener knows that a plant will not grow in a watertight receptacle, hence the provision of an outlet in the common garden pot. The main reason is that stagnant water effectually prevents the access of air which plays a very important part in the many chemical reactions necessary to fertility. Where there is good drainage air follows the water by mechanical suction. On the large scale there is no exact counterpart to the watertight receptacle, but bad drainage will always reduce fertility in proportion to its imperfection. There are several practical ways of improving drainage in soils, besides the obvious ones of digging ditches and laying drain pipes under the surface. Laying the ground in ridges or "lands," deep cultivation, and the incorporation of decayed organic matter, all play their part. Stones are also useful in this respect, and their wholesale removal is to be deprecated.

Another highly important physical property of the soil is its temperature, which will depend on a variety of causes, such as specific heat, absorption of heat, radiation, conduction and evaporation.

The specific heat of a body is the number of thermal units required to raise a unit weight of the body through 1° of temperature, compared with the standard substance water. Water, with one exception, has the highest specific heat of any known substance, hence, soils with a high capacity for absorption of water have also a high specific heat. There are both advantages and disadvantages in the possession of this property. A very high specific heat renders the soil slow to acquire the minimum temperature necessary for germination and propagation in the spring, though it ensures the equable temperature so beneficial to steady growth over an extended period. The gardener's aim is a soil where both specific heat and absorptive capacity for moisture are at the optimum, and it seems that this ideal is most nearly approached in the case of a well drained, well-tilled soil, rich in humus. Rapidity of absorption of heat, which must not be confused with rise in temperature, is a very important factor in fertility. The effects of the slope of the land and of the presence of natural or artificial barriers serving as shelter from cold winds and as a reflective background for the sun's rays are well-known. The effect of the colour of the soil itself is less frequently considered. Black soils, however, absorb heat much more rapidly than soils light in colour, and the degree of blackness is a fair index of rapidity of absorption. This accounts, in part, for the value of soot as a surface dressing, and for the traditional reputation of black soils for fertility and early maturation of crops. The reverse process of radiation takes place more rapidly

from dark soils, but absorption and radiation are not proportional, and the net advantage is always with the black soil. The effect of a surface dressing of lime is to reduce absorptive power and, where immediate warmth is required, as on a south border in spring, it is worth while nullifying this effect by forking the lime below the surface.

Other possible ways of losing heat from the soil are by conduction and evaporation. A well-tilled soil, the interstices of which are filled with air, is practically a non-conductor of heat, but hard soils, impervious to air, have some conductive power. Evaporation, since it results in the removal of a body of higher thermal capacity, is one of the most patent sources of loss of heat. This affords another reason for the prevention, by the methods previously described, of loss of moisture by this means.

Although the thermal contents of the soil are mainly derived from an outside source—the sun, the effects of internal decomposition in the soil is not negligible. Most chemical reactions take place with evolution of heat, the simplest example in the garden being the hot-bed. The same chemical reaction will always produce the same amount of heat, whether the reaction takes place slowly or quickly; but, of course, the rise in temperature is not always the same through many causes which produce variable dissipation of heat. Solution, like evaporation, when unaccompanied by chemical reaction invariably results in absorption of heat. Hence, it is theoretically true that soluble manures, such as nitrate of soda, make the ground colder, but the effect of a light dressing on such a relatively large bulk must be infinitesimal.

The soil is the physical medium in which all the chemical reactions take place that result in the production of the crop, and it is inevitable that the physical nature of this medium will have a great effect on the quality and quantity of the crop. In the laboratory nearly all reactions take place in solution—generally aqueous solution.

The root hairs provide the sole channel for absorption of food into the plant. The physical problem which presents itself to every gardener is that of bringing the two—root hairs and plant food—into contact. Nearly all the processes of culture have this as their main object.

It is obvious that the amount of food capable of being absorbed will vary with the number of root-hairs. This explains why so many types and varieties of plants flourish in reputedly poor soils. It is often solely a question of the development of root systems. By this means a plant may be enabled to extract from a given area the food that other processes do not bring to the door of those varieties which refuse to grow except in rich soils. It is probable that roots cannot function and flourish in regions where air does not penetrate, hence the added importance of drainage, deep digging, hoeing and frequent stirring of the soil. The soil must be imagined as having a structure similar to a sponge with innumerable tiny channels for the circulation of air and moisture. It is essential that the soil should have both firmness and a certain amount of resilience, otherwise, when compressed, the spaces are squeezed out, and it becomes an impervious lump. This happens especially to clayey soils when worked in wet weather, and explains why heavy tractor ploughs have been found to reduce fertility in some cases. The incorporation of decayed organic manure is a remedy for this plasticity.

The benefits of exposure of soil to frost and weather changes have long been recognised. When frozen, the water in the soil expands and forces even the most rock-like or clayey soils into fine particles. This process is facilitated by ridging to expose a greater surface. At the same time, this procedure produces aeration, which is always beneficial. Hence the desirability of leaving the surface rough in all cases when not immediately required for planting.

Although stones represent, theoretically, so

much waste of space in the soil, they nevertheless serve their purpose in soil economics. They may be compared to the pavement in the street. It is probable they assist in preserving the right of way for water and air passage and in giving resiliency to the soil.

Whatever may be the precise method of the absorption of food into the plant, it is of the highest importance that the physical condition of the soil shall be such as to favour absorption by the roots.

The advantage in supplying manure in soluble form is that it becomes immediately available to the plant, and under favourable conditions may become fully absorbed by the plant. The disadvantage is that there is always a danger of soluble matter being lost in the drainage water. To avoid the risk of this, so far as possible, certain soluble manures, such as nitrate of soda, should only be applied to growing crops.

## SPECIAL PLANTS FOR LARGE BEDS.

As a change from what are known as summer bedding plants, there are not a few fine perennials equally as effective and with long-flowering qualities, that look exceedingly well in large beds.

In fact, when removed from the many species and varieties that usually go to the making of a hardy herbaceous border they impress their individuality with greater force, and when used in the mass give pleasing and often surprising effects. No tender bedding plant or annual can provide a display so effective as some of our finest perennials.

*Hesperis matronalis plena* (Fig. 58) is one of the best of such plants. It has been for centuries a much-prized garden favourite, and nowhere looks more effective than when massed in a large bed. It is not difficult to grow when once

plants under glass and providing ideal conditions for ripening the seed capsules but with no success.

*Malva Alcea* var. *fastigata* is also worthy of a large bed to itself. It is a splendid species and for this purpose superior to the more popular *Lavatera Olbia*. *M. Alcea* is perfectly hardy and provides a showy bed for many weeks; the flowers are a delicate shade of pale rose. It may be raised from seeds while cuttings rooted in a cold frame during the summer make fine plants for the following year. This *Malva* is far less grown than it deserves to be.

*Salvia dichroa* only received the R.H.S. Award of Merit a year ago, but has long been grown in our gardens. A native of the Atlas Mountains, it is not perfectly hardy, but in the south it is rarely killed by frost. A well-filled bed of this *Salvia* is a very striking object. I remember seeing this *Salvia* at Tongwood Gardens, Hawkhurst, in 1914, in magnificent form, six feet in height, as effective as a Del-

FIG. 58. BED OF THE DOUBLE ROCKET, *HESPERIS MATRONALIS PLENA* IN HYDE PARK.

On the other hand, it is essential that insoluble manures that have to be absorbed by physical contact with the roots shall be in a finely-divided state, as, for example, basic slag, particularly when applied as a top-dressing. An exception may be made where solid matter can be placed in a position directly accessible to the roots, as, for example, quarter-inch bones in the bottom of pots or beneath the roots in a vine border.

The point that seems to be emphasised in the consideration of these physical principles is the importance of humus or decayed organic matter.

In the absorption and conservation of heat and moisture, in facilitating drainage, in providing that physical resilient texture invaluable to root-action and the passage of solvent matter, the substance we call humus plays a predominant physical part which has partly escaped recognition. All those who aim at the highest economic production must see that every possible step is taken to provide the best physical medium for the growth of crops without which much of the money spent on purely fertilising material is wasted. W. Auton.

its cultivation is understood. The passion for tidiness goes some way to account for its scarcity. The cutting down of the flower stems immediately after the flowers have faded is a ruinous procedure and usually results in the death of the plant. If these old stems are allowed to remain until growth again commences at the base, success is certain.

The purple form is a less satisfactory plant, at least, in town gardens, and the delightful lilac form shown at the R.H.S. Hall, from Aldenham, some years ago, cannot be obtained in quantity. The old plant catalogues of sixty years ago mention a red variety, but this has apparently disappeared.

*Veronica longifolia* var. *subsessilis* is another first-rate subject for a large bed. It is the finest of all the herbaceous species. It is not over hardy, being a native of the warmer parts of Japan. It has the advantage of being one of these plants that may be moved at any time without any ill effect. I have used it to replace late Tulips with great success. During hard weather a covering of dry leaves makes the plant quite safe. For some reason this species does not produce seeds in this country. I have made two attempts at seed saving, growing the

phinium and flowering well into the autumn. The plant revels in rich, rather heavy soil, and should be well fed. It seeds freely and is quite an easy plant.

The better-known *Salvia virgata nemorosa* is another splendid plant for an isolated bed. It is of the easiest culture and now well-known.

*Helenium Crimson Beauty*, raised by the late Mr. Jackman, at Woking, is a very fine plant, now coming into favour. It makes a fine bed, is a first-rate town plant, and, if given good soil and full sun, will last in beauty the whole season.

Masses of Phloxes and Delphiniums are now common features in many public parks and private gardens. Their one fault is that their period of effectiveness is short.

*Aster Thompsonii* is one of the very best plants for use in this way. Last summer, while I was visiting the Marine Parks, South Shields, a huge border of this *Aster* was a great surprise to me. It has always been considered a slow grower and scarce, but here was a border of nearly two thousand plants which were a mass of flower from early July until destroyed by frost. None of the modern, garden-raised Michaelmas Daisies can compare with this fine species in this respect. P. S.

## MESEMBRYANTHEMUM.

(Continued from p. 85).

## 2A.—MUIRIA, N. E. Br.

STEMLESS, with short, fibrous roots. Growths more or less compressed-subglobose or compressed-ovoid and sometimes slightly angular from mutual pressure, with an obscure, short, slit-like orifice below the apex on the side turned towards the centre of the clump, very fleshy, velvety-pubescent with adpressed, fine hairs. Flower solitary, just exerted from the top of the growth, with the clavate pedicel included; bractless. Calyx 6-lobed down to its union with the ovary; lobes oblong, flattish, with membranous tips. Petals numerous, free, in several series, linear, the inner very narrow and filiform-linear (staminodes?). Stamens numerous, connivent-erect; filaments not hairy at the base. Glands around the top of the ovary 6-7, broad and nearly contiguous. Stigmas 6-7, short and stout, erect, or possibly finally spreading. Ovary externally appearing inferior and very large and pear-shaped, but in reality partly superior and very shallow, being partly immersed in the very stout clavate top of the pedicel, 6-7-celled; placentas on the floor of the cells. Capsule shallow, convex on the top, with the sutures between the valves raised into ridges, and with 6-7 valves and cells; valves deltoid, when expanded horizontally spreading; expanding-keels closely contiguous so as to form a stout central keel, with broad, membranous, marginal wings as long as the valves; cells open, without cell-wings or a tubercle. Seeds many in a cell; ovoid, slightly compressed, with a nipple at one end, smooth, brown.

Only one species (*M. Hortenseae*, N. E. Br., the type of this strange genus) is at present known; a native of the Little Karoo in South Africa.

I have very great pleasure in naming this remarkable genus in honour of my friend Dr. J. Muir, and the species after his daughter Hortense, in recognition of the very great assistance Dr. Muir has rendered by sending living plants to me, with valuable information concerning them, which has enabled and will still aid me to give a much better account of many of these genera than would otherwise have been possible.

Generically, *Muiria* is more nearly allied to *Oophytum* than to any other genus, and I place it next after that genus.

1.—*M. Hortenseae*, N. E. Br. (Fig. 59).—Growths about 3-5, crowded together into a clump, each 1-1½ inch high, 1-1½ inch broad, and ½-1 inch thick, more or less compressed-subglobose or compressed-ovoid, sometimes slightly angular from mutual pressure, very obtusely rounded at the apex, with a somewhat obscure, slit-like orifice below the apex, always on the side facing towards the centre of the clump; substance very fleshy; surface smooth, velvety-pubescent, with very fine, adpressed hairs directed downwards, whitish or greyish under natural conditions, often with a rosy tint where exposed to strong sunlight, partly invested at the base with the brown, withered skins of former growths. Flowers solitary, with the thickened top of the pedicel just exerted from the burst opening of the growth, which during flowering becomes withered, wrinkled and brown. Calyx 6-lobed down to its union with the ovary, pubescent like the growth; lobes erect, 2½-3 lines long and about 2 lines broad, oblong, obtuse, membranous at the apical part. Corolla varying from 5-12 lines in diameter, cup-shaped, opening about 10 a.m. and closing between 4 and 5 in the afternoon, sweetly-scented; petals numerous, free, in several series; the outer 4-6 lines long and ½-1 line broad, linear, obtuse or obtusely pointed, the inner smaller and narrower, with the innermost linear-filiform, (staminodes?), somewhat stiff or brush-like to the touch, pure white in some flowers, in others pink at the tips or more or less tinged with very pale pink except at the base. Stamens 2-3 lines long; anthers yellow. Stigmas 6-7, erect, probably becoming erectly-

spreading, ½-1 line long, stout, acute. Ovary partly superior, shallow, conical at the top, with the cell-part immersed in the top of the stout, clavate pedicel, which is 3½-5 lines thick at that part and has the appearance of being a large inferior ovary, and is pale green. Capsule 3-3½ lines in diameter when closed, and including the obconic under part about 3 lines long, pale brown; when expanded 6-7 lines in diameter and pallid within, with yellowish-brown expanding-keels. Seeds about ½-line long, ovoid, smooth, brown, with a darker brown nipple.

Riversdale Division: In the Klein Karoo among quartz stones, at 1,200 to 1,400 feet above sea-level, flowering in December, Muir, 3885!

The cluster of somewhat egg-like bodies that constitute this strange plant render it one of the most remarkable among flowering plants, for it is quite unlike any other at present known. I have not seen a plant in flower, as the plants sent to me failed to produce flowers this season, but have described the floral structure from

FIG. 59.—MUIRIA HORTENSEAE.

A. Plant at rest, slightly reduced; B. Flower burst through the top of a growth, natural size; C. Section through a flower, enlarged two diameters; D. Hairs on a portion of surface, magnified; E. Capsules expanded, natural size; F. Section through a closed capsule.

flowers sent to me in formalin by Dr. Muir, and from information he has supplied. From which it would appear that the root-system is superficial and apparently not penetrating deeper than about 2 inches into the ground, and that in nature the growths are buried in the ground for about half their height, the portion underground being green. Dr. Muir informs me that when the plant is preparing to flower, "A hard spot is palpable in the fleshy body and the covering epidermis gets thinner and paler. This hard spot is sharply marked off from the surrounding softer substance. The flowers burst right through the fleshy body at some prominent part of the upper convexity. A fissured lesion or wound is formed, longitudinal at first (probably through the fissure), and then irregularly branched as pressure is exerted by the advancing flowers. The edges of this fissure are raw at first and exude moisture, just like any other tear or cut."

My drawing (Fig. 59) represents (at A), a plant with a cluster of three growths, slightly reduced, made from a living plant. B, is drawn from a flower sent to me in formalin and the remains of a dried growth attached to a dried flower, which may not be quite like that of a living plant, of about natural size. C, represents a section through the flower B, enlarged two diameters. D, is a magnified view of the hairs on the surface of the plant. E, shows a capsule with valves expanded, natural size; and F is a longitudinal section through a closed capsule, rather larger than the natural size.

One peculiarity of this odd plant is that the orifice is always (at least, so far as my two plants testify) on the side of the growth that faces the centre of the clump, and on the native-grown specimens is rather obscure and might easily be overlooked, but after being in cultivation here for a few months is as evident as shown in my drawing. And this seems repeated in the new growths, which form inside the old ones just as they do in the genus *Conophytum*. Upon cutting open a flowering growth sent to me by Dr. Muir, I find that the flower is terminal, arising at the point of attachment of the base of the old growth on the same side as the orifice and curving with the curvature of the growth: behind and at the base of the pedicel (which is quite bractless) arises a new growth inside the old one and, of course, invisible from outside, curving conformably with the old one, the curvature being due to the fact that the actual attachment of each growth to the rootstock is about 3-4 lines above the base of the growth on the same side as the orifice. Evidently this plant is of very slow growth and does not increase often. N. E. Brown.

(To be continued.)

[Since the above was written I have received flowering growths of this plant passing into the resting stage, and on cutting one open was surprised to find that the tissue within the skin of the old growth consisted entirely of very large, loose and separate globose cells, varying from half a line to one-and-a-half-line in diameter, each glistening like a dew-drop, having a thin, but somewhat tough cell-wall and clear, colourless watery contents. Under a microscope I noted that the outside of the wall of these cells was marked with outlines of small cells that had been in contact with it, but had now disappeared. As I had never, in any plant, seen a collection of large, loose cells of this character, I wished to ascertain their origin and purpose, and therefore sacrificed one of my non-flowering growths by cutting a piece from it to examine its structure, when I found that the whole interior is filled with these large, globose cells with all the spaces between them filled in with a connecting tissue of very small cells firmly binding them together into a fleshy substance, all of it with clear, colourless, watery contents, as the chlorophyll is only evident when highly magnified, the granules being sparsely scattered over the walls of the outer cells, a few even in the large cells, and are excessively small. From this it seems evident that when the plant prepares to go to rest in the very arid region it inhabits, the substance of the connecting tissue is first used up and seems to disappear entirely, leaving only the large cells to supply the new growth contained in the old one with moisture, or perhaps more probably, to retain moisture around it during the dry season, or until rain falls and the new growth starts developing. It is evident that these large cells (which are botanically called idioblasts) are capable of retaining their watery contents without drying up for a long time and in a manner that I have never observed other cells or sections of tissue to do. I removed some of these large, loose cells and placed some on a piece of glass and some on a piece of paper, all isolated, and allowed them to remain uncovered in an ordinary living room. As I write they have now been exposed to the dry air of the room for over one hundred hours, and seem just as fresh, as plump, and as glistening as when I first removed them from the old growth. If they can do this when separated and in such exposed conditions it is very evident that when protected by the skin of the growth they must preserve their fluid contents for a very long time.

## BOULTON & PAUL GARDEN FRAMES

High grade, solidly built. Renowned for durability, strength and simplicity

Carriage paid to most stations in England and Wales.  
Packing extra, but allowed for if returned.

### TYPICAL EXAMPLES

No. H.75

ESTABLISHED 1900

and probably gradually supply moisture to the young growth that they surround inside the old one. Yet, when one of these cells is burst, its watery contents dries up quickly. These large cells do not contain crystals, which is one of the functions of idioblasts, but there are also much smaller idioblasts mingled with the tissue containing bundles of needle-like crystals (raphides), which are excreta. And I have hitherto regarded all these large cells or idioblasts (which exist in most genera of this group, the familiar pellucid and dark dots being due to them) as functioning only as excretory cells, for they frequently contain tannin or crystals and are thrown off with the dried skins or dead leaves, but from the behaviour of those of this singular plant, as above recorded, it is possible that besides that purpose they also function as special structures whereby these plants are enabled to endure and survive the long drought and intense heat to which they are subjected. They are worthy of more careful examination than I am able to give them. N. E. Brown.)

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Continued from p. 81).

### JOCOTE AND HOG PLUM.

THE Jocote, or Ciruela (*Spondias purpurea*), is the fruit of a small, pretty tree, which, on Ruatan Island, is found in the wild and the cultivated state. It is easy to propagate either from seeds or cuttings, and is occasionally used to make live fences. When the tree produces its dark red or purple blossoms, which are borne on the larger branches only, the leaves drop and new ones do not appear until the fruits begin to ripen. The latter are purple in colour, oval-shaped, and of a sourish-aromatic flavour, with a very large stone in the centre. They are either eaten raw or made into preserves and into a fermented beverage. On the mainland there is also a variety bearing yellow fruits.

The Hog Plum or Jobo (*Spondias lutea*) grows on a forest tree, reaching a height of 100 feet (say 30m.) with light and soft wood of no value. This tree is never cultivated, but, like the preceding species, it is sometimes used for fence posts, as it takes root and keeps alive like Willow. The yellow fruit is much esteemed by the hogs which accounts for its local English name. It has a comparatively larger stone than the Jocote, its close relative; the flesh is also inferior in quality, having a rather acid flavour. When the fruits are maturing the air for a considerable distance from the tree is laden with a very pleasant scent.

### CITRUS FRUITS AND TAMARIND.

The Citrus Fruits, which are of Asiatic origin, do not thrive well in the Bay Islands, and certain species of them are frequently attacked by the leaf-cutting ants. The most common of these fruits is the Sweet Orange or Naranja Dulce (*Citrus Aurantium*, L. Risso), which is propagated from seeds or by budding or grafting on Sour Orange trees. By the former method the tree will not begin to bear fruit until ten or more years after planting. By budding or grafting, however, they will bear within four or five years.

The Toronja, or Grape Fruit (*C. decumana*) (Fig. 60), so called from its habit of growing in clusters, is globose in shape, while the true Shaddock is slightly Pear-shaped. The fruit has medicinal properties; it has a bitter rind and acid pulp, and is eaten with sugar. It will keep for some time if taken from the tree before complete maturity, and in former days small quantities of Grape Fruits were shipped to the United States.

The Citron or Cidra (*C. Medica*, Lin.), is sometimes cultivated for the sake of its thick inner rind which is made into preserves. Other

species found in the Bay Islands are the Lime or Lima (*C. Limetta*, Risso), the Sweet Lime or Lima Dulce (*C. Limonum* var. *dulcis*, Risso), and the Lemon or Limon (*C. Medica* Limon).

The Tamarind or Tamarindo (*Tamarindus indica*) is a big tree of Asiatic origin, with yellow wood and pinnate leaves, but now cultivated throughout the tropics. It grows very slowly but reaches a great age, and is esteemed for its fruits and its shade. It bears red-striped, yellow flowers which develop into an edible pod with a somewhat acid pulp. It begins to bear about the eighth year from planting, and its fruits ripen from June to August.

There are two species of Tamarind, the East Indian (*T. indica*) and the West Indian (*T. occidentalis*), but some botanists classify both as *T. indica*. As a matter of fact, the trees and the flowers are absolutely alike in both varieties, the only difference consisting in the

sweet, yellowish pulp of very pleasant taste, which is eaten raw; in certain parts of the West Indies preserves are made from it, hence the name Marmalade Plum, by which it is sometimes called. As the fruits may easily be kept one or two weeks, it is rather surprising that, so far, no attempt has been made to introduce them to the North American markets. The cultivated variety is much larger than the wild one, and contains from four to six (sometimes even more) black seeds, while the latter has only from one to three seeds.

The very hard, heavy, fine-grained wood is reddish in colour and resembles mahogany; it is locally used for axe handles, in cabinet making, and in construction work. In parts of Central America and Mexico it has been used for railway ties (sleepers), but on account of its hardness it is very difficult to drive spikes into it. This wood is nearly indestructible,

FIG. 60.—GRAPE FRUITS SHOWN BY CECIL HANBURY, ESQ., AT THE MEETING OF THE ROYAL HORTICULTURAL SOCIETY ON JANUARY 25.

shape, size and taste of the fruit. The West Indian variety, which is the one found in the Bay Islands, bears pods three to four inches in length, containing from two to four seeds. The East Indian Tamarind has larger fruits with six to twelve seeds, which are sweeter in taste than the other one. The leaf-cutting ants very frequently kill this tree in the Bay Islands.

### NASEBERRY AND MAMMEE APPLE.

The Naseberry or Nisberry tree (*Achras Sapota* L., *Sapota Zapotilla*, Coville) is found both in the wild and in the cultivated state; it belongs to the family of the Sapotaceae. The wood is generally known as Sapodilla among the English, and this name is also commonly applied to the forest tree, but never to the cultivated one. The Ladinos call it Nispero, a name applied in Spain to two entirely different trees, which are both absent from Central America, viz., the Loquat or Japanese Medlar (*Eriobotrya japonica*), and the true Medlar (*Mespilus germanica*).

The Central American Nispero bears round fruits with a rough, reddish skin, suggesting an Irish Potato with earth adhering. It has

and the Toredos does not attack it. In the lowlands of British Honduras, the adjacent part of Guatemala, and the Mexican States of Yucatan, Tabasco and Chiapas, this tree is found in great abundance and furnishes Chicle from which chewing-gum is made. Chicle is obtained by the evaporation of the milky juice which is secured by tapping the tree.

*Calocarpum mammosum* Pierre; *Acrodelpha mammosa*, Cook, and *Lucuma mammosa* Gaertn., are the three different names under which the tree bearing the Mammee Apple, Mamey Apple or Red Mammee (Japote, in Spanish), has been described by botanists. It is often confused with the preceding species, and like it, is also sometimes called Marmalade

Plum, as it is occasionally made into preserves. The tree reaches a great size and has undivided green leaves which grow in clusters. The fruit is about the size of a large Lemon, and has a russet coloured, thick, rough skin, under which there is a reddish-brown pulp. It contains single, sometimes two, large seeds, elliptical in shape, and polished except on the dental surface. The pulp is sweet, rich and pleasantly flavoured, but somewhat insipid.

**KRABO, SEA GRAPE AND COCO PLUM.**

The tree, known locally by the Mosquito name of "Krabo," (*Byrsonima crassifolia*, H. B. K.) and in Spanish as Nance and Nancito, is characteristic of the dry savannas, and is very abundant on arid and stony soil in Ruatan and Bonacca. It is a small, gnarled tree, the bark of which is excellent for tanning purposes, while the wood furnishes a good quality of charcoal. It bears very small, yellow, aromatic, drupaceous berries, which are commonly eaten by the children. The hogs like to feed upon it, and in some regions of the Mosquito coast, this is practically their only food during several months of the year. It is claimed that the lard obtained from hogs which have been largely fed on Krabos will not coagulate. A cultivated variety of this tree is also found in the Bay Islands, and this bears a larger and sweeter fruit.

The Beach Grape, Sea Grape or Uva del Mar (*Coccoloba uvifera*, L.), grows on a low, gnarled tree with a smooth white bark, and thick, leathery, heart-shaped leaves. There are several varieties which all bear white blossoms with pleasant scent, which produce small, Grape-like fruits, of a reddish, purplish or dark-bluish colour. They are sweet-acid in taste, and are eaten by the children, but they have very little pulp, consisting nearly entirely of skin and stone. The tree is one of the many plants yielding the commercial product known as Kino, which is used in tanning, dyeing and as an astringent in medicine.

The Coco (Cocoa) Plum or Icaco (*Chrysobalanus Icaco*), grows on a shrub or small tree with oval, nearly round leaves, which is found along the sandy, sea beach. The edible, round fruit is about the size of a Plum. Several varieties exist, bearing red, black or white fruits, but the first-named is the most common. The black variety bears the smallest Plum, but this is also the sweetest. The fruits are eaten raw by children, and make excellent preserves. The bark, root and fruit are also used as a black dye. *Edouard Conzemius, 33, Boulevard des Batignolles, Paris.*

(To be continued.)

**A NEW DISEASE OF FREESIA.**

DURING the past few years, there has appeared a new and mysterious complaint among Freesias. It would be interesting to know how widely this is distributed and what, if any, remedial measures have been found satisfactory. I particularly use the word "complaint" rather than "disease," for at the moment it cannot be said that the trouble is due to a fungus or bacteria. I have carefully examined affected plants under a powerful microscope and I can find nothing whatever which conforms to any of the known parasitic or fungous troubles incidental to plant life. I have also the assurance of Mr. George H. Pethybridge, mycologist to the Plant Pathological Laboratory, Harpenden, that he is unable to detect the presence of any fungus in the tissues of the leaves submitted. He has also submitted leaves to entomologists who were not satisfied that the damage was due to any insect pest.

Affected plants start to grow readily from the dormant bulb and produce two or three healthy leaves. Suddenly (within the course of forty-eight hours) one or more of the leaves develop a series of brownish spots. As these spots develop, the tissues wither; gradually, in the course of a few days, the spots merge together and the whole leaf becomes withered and useless. It is a curious fact that in the majority of cases new growths are not affected, that is to say, one leaf may be withered and useless while the young growth as yet unaffected appears to be perfectly healthy. Badly affected plants wither up and collapse entirely, generally before any sign of flower appears.

From enquiries I have made on the subject, I gather that a number of the foremost growers of Freesias are suffering serious loss from the

same trouble, which appears to be very largely confined to the new race of coloured Freesias, and is developing badly from year to year.

*Freesia refracta alba* appears to be practically free—or nearly immune—but the devastation among choicer hybrids is becoming a subject of very grave anxiety.

The greatest difficulty appears to be the present impossibility of classifying the complaint; it may be an unclassified form of Mosaic disease, but whatever it is, there is urgent need of investigation as to the cause.

The late Rev. J. Jacobs was considerably troubled and hazarded the opinion that the complaint probably originated from the twigs used in the support of the plants. I do not think that this view can be maintained. I have tried the experiment of pinning an affected leaf on a healthy plant; the results were entirely negative, from which it would appear that the disease does not spread by contact, even where the tissues of a healthy plant have been ruptured. Virgin and sterilised soils appear to make no difference to the spread of the trouble. There remains the possibility that it may be inherent in certain varieties; Excelsior notably appears to be more susceptible than others. Seedlings grown throughout in virgin soil fall victims as readily as mature bulbs and offsets.

I have found that plants grown under warm conditions are affected more readily than those grown under the coolest possible treatment. A curious illustration of this is that I have lifted affected plants, washed the roots, snipped off the withered leaves, repotted them and placed them in a cold frame. The new growths in many instances appeared to be entirely free from trouble, but the severe check occasioned by the disturbance reacts on the plants very considerably and delays their flowering. I have also tried dusting the leaves with flowers of sulphur, and I am inclined to think that the plants have benefited from this treatment, but I should very much welcome the views of other growers as to the theory of origin and a satisfactory method of treatment. The investigation of this trouble is the more urgent in that improvements in varieties are progressing rapidly, and it is a cause of deep concern that this newly developing family of fragrant and popular flowers should be menaced by an apparently new and obscure complaint which, at its worst, threatens them with the possibility of extinction. *Herbert G. Longford, Abingdon, Berkshire.*

**FRUIT REGISTER.****PLUM DIAMOND.**

REGARDING Plum Diamond described on p. 71 of your issue January 22), the origin of a fruit or plant is sometimes more interesting than useful, but the fruit is the chief thing for all that. Plum Diamond is described as dark purple (almost black), and the illustration (Fig. 39) bears a strong resemblance to a Plum I have seen in East Surrey under the name of Black Diamond. In that neighbourhood it also was called the Castle Plum, as tradition gave it as having been raised at Starboro' Castle.

Several good trees were stated to be growing on their own roots, and suckers were exchanged between neighbours. I have not seen one which was not worked. The growth is upright and the fruits of excellent dessert flavour. On standard trees these ripened after Victoria growing against a wall. I am wondering if this is the same Plum. The remarks concerning Apple Rev. W. Wilks I can fully bear out, except alas! it did not bear fruit last season. Its growth is clean and vigorous and the fruit will cook well when taken straight from the tree. *J. E.*

—With reference to the origin of this variety of Plum, I based my statement in my *Handbook* on a note in my father's copy of *Hogg's Fruit Manual*, which runs as follows:—"This was found in a hedge by an old man named Diamond,

whom I have talked with, and was propagated, not raised, in Mr. Hooker's nursery." *E. A. Bunyard, The Royal Nurseries, Maidstone.*

—Mr. Charles E. Pearson, in his short note, on p. 86, mentions this Plum as being known in the midlands as Black Diamond. As a midland dweller, I can add testimony to this, and I also hold the same opinion as Mr. Pearson in regard to its fine culinary qualities. But in studying the fruit markets of the midlands, chiefly those at Evesham, Birmingham and Stratford-on-Avon, during the past three seasons, I have been surprised at the poor prices realised per "pot" (72 lbs.) for this Plum. Black Diamonds, although never in "glut," are very little in demand at any time, and at fruit auctions I have heard dealers say "They're only Black Diamonds," and the Plums would be knocked down to someone for considerably less, very often, than, say, a pot of Yellow Pershore. This Plum "travels" badly when fully ripe, yet the unripe fruits are purplish-green and as hard as the proverbial bullet. From a commercial point of view, therefore, Black Diamond is of little value. But in gardens where ample space is available, I should certainly advocate growing the variety, for it is a vigorous grower. It is best trained as a bush.

I do not altogether agree with Mr. Pearson when he states that it is by no means a heavy cropper. It is true I have been in localities where it is a shy bearer, but in many others I have seen heavy crops of Diamond and have found a good crop to be usual. The rankness of its growth no doubt has something to do with its shyness in bearing, at least, in some cases. I have one very large tree with ugly, great limbs, and very little fruit is ever borne by it. But two smaller trees in the vicinity, better-shaped and conditioned by restricting the growths, have borne good crops during the three seasons they have been under my charge.

The tree is, unfortunately, susceptible to aphid attacks, and as Mr. Pearson remarks, it is always the first sort to show the foliage curling with fly. Nevertheless, it is a great pity Diamond Plum is not more appreciated. *H. W. Stenning.*

**VEGETABLE GARDEN.****EARLY CARROTS IN FRAMES.**

ON p. 55, Mr. W. Auton describes the method of growing early Carrots in frames. It is quite possible to produce early Carrots without going to the trouble of collecting leaves and stable manure and making a hot-bed of them. When using a brick-pit for such crops as Carrots, Lettuces or Radishes, I throw the soil out of the first light into the next, and if any stable manure is available, I put in two barrow-loads and tread it down firmly. If stable manure cannot be had, I use ordinary cow manure, such as is dug into the garden, turn the soil back on the manure and continue the process until the row of pits is finished. The seeds are sown in drills, the method being more convenient for weeding. The lights are kept closed until germination takes place, then tilted a little when the sun shines. The lights are never pulled off except when watering the crops, until the Carrots are fit to pull, which is equally as soon as my neighbours who adhere to the more laborious method which Mr. Auton describes. *Grigor Roy.*

**THE LEEK.**

THE Leek, *Allium Porrum*, when well-grown and thoroughly blanched, constitutes an excellent and wholesome vegetable, with medicinal qualities, besides being very valuable as a pot-herb; moreover, it succeeds on the lighter soils where the cultivation of the Onion often presents great difficulties and can, at times, be used as a substitute for that vegetable, which is always in such great demand.

The Leek is a true biennial, that is, it requires nearly a whole year of normal growths before it prepares to flower and produce seed, which it does in the course of the second year. The

edible portion consists of the leaves which spring from the upper part of a flat stem, sheathing each other at the base and folding longitudinally to the point and forming a solid, stem-like structure of considerable length. It is essentially a winter and spring vegetable, but supplies may be maintained if wanted during the greater part of the year. The essentials of cultivation are a rich, well-worked soil and abundance of water during the growing season. If supplies are wanted early, a small sowing should be made in heat in January or the beginning of February, the young plants grown on under glass and gradually hardened off for planting outside at the end of March or the beginning of April.

The maincrop may be sown outside in March, and another sowing should be made at the end of April or beginning of May for the late crop. From this sowing supplies may be maintained during the spring till May or even June, when the flower-stems begin to develop.

There are several methods of cultivation, and a good system for producing very fine Leeks is to make trenches in the same way as for Celery. If the trenches are well-prepared, left six to nine inches deep and used for early plants which have been hardened off, they afford them considerable protection and make it convenient for the application of water or manure during the summer. Excellent Leeks may be grown, however, without adopting the somewhat expensive system of trenches, by planting in well-drawn-out drills on deeply-worked soil, at a sufficient distance between the rows to allow of thorough earthing-up.

Still another system of planting is adopted in many gardens with good results. Holes about six to nine inches deep are made on a well-prepared bed and a plant is dibbled into each. As the plant grows, the hole is gradually filled up by surface hoeings and finally some earthing up may also be done, when fine Leeks with a good length of blanched stem are produced. Well-blanching Leeks may be served at table in the same way as Seakale and make a first-class substitute for that delicious vegetable. A. P. C.

## FUNGI AS AN INTERNATIONAL PROBLEM.

A NOTE in *The Gardeners' Chronicle* for January 29, 1927, page 77, reporting a paper communication to the Botanical Society of Edinburgh on "Fungi as an International Problem," has been brought to my attention. The report contains certain statements which were not stated by myself when the above-mentioned paper was read. These statements are:—(1) "... plant quarantine laws for the regulation of foreign plant importation were instituted in 1912, and two years later Canada adopted similar protection measures." This should read:— "... were instituted in 1912, two years after Canada had adopted plant quarantine measures." (2) "... The blister rust of Weymouth Pine was another serious forest disease which originated in Siberia and had existed in Europe for sixty-five years." This should read:— "... and had existed in Europe for at least sixty-five years ... Just how long the Blister rust has actually been present in Europe is not definitely known. It has probably been present in Europe many years before the first record of the disease was made in 1854. The serious Woodgate rust, recently discovered on Scots Pine in the United States, was overlooked by your reporter. Moreover, he failed to mention the successful inoculation results on Douglas Fir with the *Phomopsis* causing Douglas Fir canker, which canker was recently described by Dr. Malcolm Wilson. These last two items are of particular interest to British foresters.

Will you please be so good as to allow these corrections, because the library at the United States Department of Agriculture catalogues articles that appear in *The Gardeners' Chronicle*,

and I do not wish it to go on record as having made such incorrect statements.

With regard to the two matters omitted, it may interest your readers to know that new Gall-rust disease threatens the Scots Pine in America. Recently a gall-rust has been found in the United States on the Scots Pine. At present the source of this rust is not known, for it does not resemble any known rust either there or in Europe. So far, it has been only found on the European species in New York. Until this new rust, which has been reported by Dr. Harlan H. York, of the New York Conservation Commission, in *Science*, November 19, 1926, under title "A Peridermium new to the north-eastern United States," can be identified and its source determined, it is known as the Woodgate rust, after the name of the town in New York State, where it was first found. Whatever the Woodgate rust may be or from whatever part of the world it comes, there is no doubt that this rust seriously threatens the Scots Pine in America. This newly discovered rust is very probably able to pass directly from tree to tree without the intervention of an alternate host plant, a necessity in the case of the Blister rust of Weymouth Pine. (A recent account of the new gall-rust of the Scots Pine appears in *The Official Record* of the U.S. Dept. Agr., issue of December 8, 1926).

An infectious canker disease of the Douglas Fir has been recently found in Britain and described by Dr. Malcolm Wilson. This disease is not known to occur in America, where there are very valuable forests of Douglas Fir on the Pacific coast. Preliminary inoculation experiments with the organism to which the canker disease has been attributed, have shown a high percentage of infection. These inoculation experiments are being carried out in the vicinity of Edinburgh, by Dr. Wilson and the author (G. G. Hahn). *Glenn Gardner Hahn*.

[We are pleased to publish the above corrections with the additional information so kindly furnished by Mr. Hahn.—Eds.]

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**An Amateur's Celery.**—On the occasion of the visit of Mr. Jones to the Guildford Association in December, Mr. J. Hall, an amateur member of the Society, brought to the meeting two sticks of Celery grown on his allotment. Mr. Hall was awarded a First Class Certificate for his exhibit. Later, he received a letter from Messrs. Sutton and Sons stating that they had rarely seen such good Celery so late in the season, and congratulating the grower on his success. Mr. Hall is a frequent exhibitor at local shows and has won many prizes. *W. F. S.*

**Fumigants for White Fly.**—In reading your issue of the 22nd ult., I was interested in the second paragraph of your Answers to Correspondents on "White Fly Fumigants and Plants," where you make the comment that if a fumigant was known capable of killing white fly on *Chrysanthemums*, it would soon be placed on the market. In this connection there is an interesting article in the January issue of the *Scottish Journal of Agriculture*, "Calcium cyanide as a Glasshouse Fumigant," by Mr. H. W. Miles, an extract from which is as follows:—"The greenhouse white-fly, *Trialeurodes vaporariorum*, Westw., has been successfully controlled with dosages varying from one-twelfth ounce per 1,000 cubic feet in spring, to two-thirds ounce per 1,000 cubic feet in autumn. The temperature of the houses at the time of the fumigation has varied from 52°F. to 77°F., and the relative humidity varied from 71 per cent. to 95 per cent. It has been found that low dosages in spring give effective control, and fumigations repeated at intervals keep the pest in check throughout the season. Towards the end of the summer, however, when with many crops the glasshouse conditions become rather dry, dosages up to two-thirds ounce per 1,000 cubic feet may be necessary to give a complete kill of the adult insects. Plants fumigated for the control of

white fly include Tomato, Arum, *Chrysanthemum*, Cucumber, Runner Bean, Freesia and Azalea." The fumigant referred to would appear to be effective and economical. I have personally had experience of the use of calcium cyanide fumigation for white fly on Tomatoes, the results of which were extremely satisfactory. *M. S. Henderson, Rutherford, Clifford Road, New Barnet.*

**Deep Trenching.**—I annually bring the subsoil up, and would certainly never adopt any other system here. The subsoil of this garden varies from clay to sand, and what I consider a worse material, known locally as "sammel." This is of a marly nature, plentifully mixed with small limestone cobbles, and before the advent of tar macadam, was used for making and surfacing the roads locally. It is a substance which runs together and sets extremely hard with rain, and, unless loaded in the carts dry, will quickly form into a solid block during transit, requiring a pick to break it up again. The kitchen garden subsoil was solid "sammel" five years ago. A new spade would bring a few inches of it up with the first spit. I have trenched that up, throwing the second spit on top. At the bottom of the second spit is solid rock, otherwise I would dig deeper. During the first two years I had charge here, the major portion of the garden was under the plough, owing to shortage of labour, and such vegetables as Peas were a failure. Onions would wilt and fall over during June and July, and greens were hopeless. The first year after trenching so marked was the effect, I at once resolved to trench more in future, and this year I intend to trench about two acres. Lest any reader may attribute the benefit to manure, let me hasten to assure him such is not the case. Part of my kitchen garden must annually go without farmyard manure on account of a shortage of that commodity, yet at our county show last year I secured twenty-four awards out of a total of twenty-seven exhibits, which surely speaks well for the system advocated by Mr. Beckett. *F. C. King, Levens Hall Gardens, Milnthorpe.*

—*G. D.* questions the value of deep trenching and bringing the subsoil to the surface, no matter what it is like, as recommended by Mr. Beckett. I quite agree with *G. D.* when dealing with the class of subsoil he has; this should be broken up, well mixed with manure and other materials that will lighten it, and left there for several years. I quite agree with *G. D.* when he states that the illustrations reproduced in *The Gardeners' Chronicle* in support of Mr. Beckett's remarks on deep trenching are very striking, more especially as Broccoli plants are in question. If it had been Peas, Onions or other plants, that require a deep-rooting medium, the pictures may have appealed differently. Broccoli, so far as my experience goes, would be one of the last crops to plant on deep and newly-trenched land, as I find they are never a success when planted on loose ground, no matter how well it has been manured and worked. The best Broccoli that I have ever seen or grown were on land that was previously a Strawberry bed for three years. The Strawberry plants were simply cleared away, holes made with a bar, and the Broccoli plants set in them. Deep cultivation I agree with, but much depends on the nature of the soil. Clayey and brashy subsoil should only be brought to the surface with caution; it should first be broken up and made suitable before bringing it to the surface. Some years ago, I followed a young and enthusiastic gardener who trenched the soil as mentioned by *G. D.*, and the crops were not successful until the subsoil was placed underneath again. Far better have one foot of good, fertile soil than three feet of hungry clay to deal with, and it is much worse where the subsoil is shale and sandstone. This, if broken up, forms good drainage, but if brought to the surface causes trouble that will not cease until it is back again in its original position. Mr. Beckett is, as we all know, a past-master in the art of cultivating vegetables, but we are not all so fortunate in having his class of soil to deal with. *W. E. Wright, Tregarth Gardens, Creigiau, near Cardiff.*

## SOCIETIES.

## ROYAL HORTICULTURAL.

FEBRUARY 8.—The Annual General Meeting of the Fellows evidently induced a decidedly larger attendance at Vincent Square than is usual at this time of the year. There was an especially good show to occupy the attention of the visitors. Orchid groups were numerous and these contained many particularly good specimens. The Orchid Committee gave two First Class Certificates and four Awards of Merit to novelties. The principal floral features were groups of forced shrubs, a pleasant spring garden, also spring flowers on the staging, greenhouse Cyclamen, Carnations and alpinas. The Floral Committee recommended one First Class Certificate and four Awards of Merit to novelties. The Narcissus and Tulip Committee met for the first time this season and recommended an Award of Merit to a Trumpet Daffodil. The Fruit and Vegetable Committee found an interesting variety of exhibits for consideration. There were excellent collections of vegetables, Apples, and Citrus in pots. The new exhibitors' cards for floral novelties which enable exhibitors to present interesting particulars of their plants should appeal to the Fellows, though the colours of the cards may not. There is still room for improvement in calligraphy to render the names of the plants and senders more easily read.

## Orchid Committee.

**Present:** Sir Jeremiah Colman Bt. (in the chair) Mr. Gurney Wilson (Hon. Sec.), Mr. C. J. Lucas, Mr. Fred J. Hanbury, Mr. C. Cookson, Mr. T. Armstrong, Mr. A. McBean, Mr. J. Cowan, Mr. Robert Paterson, Mr. H. H. Smith, Mr. John Cypher, Mr. J. E. Shill, Mr. Fred. K. Sander, Mr. H. G. Alexander, Mr. Chas. H. Curtis, Mr. J. Dye, Mr. S. Flory, Mr. H. T. Pitt, Mr. Wilson Potter, Mr. E. R. Ashton and Mr. S. Low.

## FIRST CLASS CERTIFICATES.

*Cattleya White Empress, Brockhurst var. (Trianae Broomhill var. × Suzanne Hye de Crom).*—A very beautiful *Cattleya* of fine form and size; white, except for the pale yellow throat. Shown by FRED J. HANBURY, Esq., Brockhurst, East Grinstead.

*Cypripedium Mrs. Eley var. W. G. (Christopher × Commodore).*—A fine, large hybrid, with rounded, white, green-based dorsal sepal, the green area and part of the white being spotted with purple-brown; petals pale green, with pale brown spots and veins; lip light green. Shown by G. F. MOORE, Esq. (gr. Mr. Page), Chardwar, Bourton-on-the-Water.

## AWARDS OF MERIT.

*Vuystekeara Leda (Vuystekeara Brewii × Odontoglossum Radiant).*—The flowers of this hybrid are of large *Odontoglossum* size, flattish, and of fine substance. The broad lip is white at the base, heavily marked with red-brown, and there is also a red-brown mark and red dots on the waved, rose-coloured apex; the sepals and petals are rich red-brown, with some of the white ground showing between the heavy markings. Shown by Messrs. CHARLESWORTH AND CO.

*Cymbidium Erica Sander var. Goldilocks (Hookeriana × Pauwelsii).*—A charming hybrid bearing its flowers in long, graceful spikes. The flowers are light green-tinted yellow, with deeper yellow, brown-marked lip. Shown by Messrs. SANDERS.

*Cypripedium Seckon var. Biddy (viridissima × Christopher).*—This has an enormously wide and rounded dorsal sepal, white with a small, pale green base; petals pale Apple-green, with a median band of dull brownish-purple; lip pale green. Shown by G. F. MOORE, Esq.

*Cypripedium Robert Paterson var. Westminster (Memoria F. M. Ogilvie × Eurybiades).*—A bold hybrid, stiff, rounded, white dorsal sepal, heavily spotted with blackish purple; petals green along the ventral half, and brown on the upper part; lip green and purplish brown. Shown by H. T. PITT, Esq., Rosslyn, Stamford Hill.

## PRELIMINARY COMMENDATION.

*Odontoglossum Armstrongiae, Gerriah's var.*—A rounded flower of soft orange-yellow colouring. Shown by G. GERRISH, Esq. (gr. Mr. Sorrell), Milford Manor, Salisbury.

## GROUPS.

The largest exhibit was from Messrs. CHARLESWORTH AND CO., who had a very fine display of *Odontoglossum crispum*, *O. Fabia*, *O. lutescens*, *Odontioda Maureen*, *O. Cooksoniae*, *Wilsonara Wendy*, *Vanda teres alba*, *Dendrobium Thwaitesiae*, the effective *Miltonia Princess Mary*, *Cattleya Trianae*, *Brasso-Laelio-Cattleya Cliftoni*, *Cypripedium Morganiae var. burfordiense* and many other fine things.

Messrs. H. G. ALEXANDER, LTD., exhibited fine plants of *Cymbidium Bustard var. sulphureum*, very handsome; *C. Gottianum*, *Westonbirt var.*, and *C. Lowii-grandiflorum*, *Westonbirt var.*; with these were grouped three splendid plants of *Coelogyne Mooreana*, *Westonbirt var.*, carrying an aggregate of nine spikes of white flowers; *Laelio-Cattleya Schröderiana*, *Cattleya Egret*, the brilliant *L.-C. Fatima*, and *Cypripedium Maudiae*. Altogether a very interesting group.

Cymbidiums were a fine feature in the large group arranged by Messrs. SANDERS, and conspicuously good in the centre of the display was a large specimen of *C. Ceres* with six handsome spikes; other good Cymbidiums included *C. Erica Sander var. Goldilocks*, *C. Pauwelsii*, *Bruges Belle*, *C. Louis Sander* and *C. Albatross var. Verulam*, with very large blooms. *Cattleya Marceliana var. superba*, *Brasso-Cattleya Massangeana*, *Calanthes* and *Cypripediums* were also shown by the St. Albans firm, and along the front of their group they had many interesting botanical Orchids, such as *Angraecum eburneum*, *Trias picta*, *Pleurothallis Roezlii*, with its drooping spikes of black flowers; *Cirrhopetalum picturatum*, *Bulbophyllum mirum* and *Restrepia striata*.

Messrs. J. AND A. McBEAN showed a very bright group, wherein *Odontoglossum triumphorum*, with light yellow, brown-marked flowers, was very effective; *Laelio-Cattleya Smilax var. Prince of Orange* was also fine in colour, while *Laelio-Cattleya Schroderae*, *Brasso-Cattleya British Queen*, *Cattleya Cowaniana alba*, *Dendrobium Thwaitesiae* and *Cypripedium Boltoni* were other good subjects shown in addition to *Odontiodas* and *Cypripediums*.

In the exhibit from H. T. PITT, Esq. (gr. Mr. Thurgood), were some good forms of *Odontoglossum crispum*, *Epidendrum Endresio-Wallisii*, the pale *Lycaste costata*, *Cypripedium Rothschildianum*, *Odontoglossum Aristophanes var. Purple Prince*, *O. St. James*, *Cypripedium Forest King* and several capital Cymbidiums. Cypripediums were very much to the fore in Messrs. J. CYPHER AND SONS' group, and leading sorts were *C. Queen of the Belgians*, *C. Minos Youngii* and *C. Nydia*; behind these were *Laelio anceps*, Cymbidiums and *Dendrobiums*.

Messrs. ARMSTRONG AND BROWN's exhibit consisted principally of nine specimen plants of the lovely *Laelio-Cattleya Schröderae*, the large central plant having twenty-two flowers on a total of four spikes; these were very greatly admired. The rare *Dendrobium Ainsworthii* was also shown. *Sophras-Cattleya Wellesleyae* and *Cypripedium Baldoran* were good things in Messrs. FLODY AND BLACK's small exhibit. *Mormodes colossus*, with quaint, green flowers, was shown by Messrs. A. J. KEELING AND SON.

The handsome *Dendrobiums* in Mr. HARRY DIXON's group were excellent examples of *D. Melpomene*, *D. Magda*, *D. Apollo var. grandiflora*, *D. Apollo var. albens*, *D. nobile virginale*, and the free-flowering *D. xanthocentrum*. Messrs. SUTTON BROS. submitted a group of Cymbidiums, *Laelio-Cattleyas*, *Cypripedium Maudiae*, *C. insigne Sanderiae*, *Odontoglossums* and *Dendrobiums*. In Messrs. STUART LOW AND CO.'s group we noticed the yellow *Brasso-Laelio-Cattleya Cissie*, *L.-C. Schröderae*, *Laelio-Cattleya Serbia*, the old *Laelia harpophylla*, *Bulbophyllum virescens* and numerous *Odontoglossums* and *Odontiodas*.

*Oncidium splendidum* was well shown by Messrs. COWAN AND CO., who also showed excellent Cymbidiums, some capital plants of *Masdevallia Schröderiana*, and the very pleasing *Cypripedium Zeus*.

## Floral Committee.

**Present:** Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Arthur Turner, Lady Beatrix Stanley, Mrs. Ethel M. Wightman, Mr. G. W. Leak, Mr. H. J. Jones, Mr. J. M. Bridgeford, Mr. D. Ingamells, Mr. William Howe, Mr. W. A. Bilney, Mr. R. Findlay, Mr. Donald Allan, Mr. E. R. Janes, Mr. A. E. Vasey, Mr. James B. Riding, Mr. George Churcher, Mr. W. B. Gingell, Mr. D. B. Crane, Mrs. Helen Lindsay-Smith and Mr. W. P. Thomson.

Section B.—Mr. Gerald B. Loder (in the chair), Mr. E. A. Bowles, Mr. G. Reuthe, Mr. F. J. Preston, Mr. W. B. Cranfield, Mr. Mark Fenwick, Mr. L. R. Russell, Mr. E. H. Wilding, Mr. A. Bedford, Mr. T. Hay, Mr. Charles T. Musgrave, Mr. Reginald Cory, Mr. W. J. Bean, Mr. James Hudson, Mr. Clarence Elliott, Mr. G. W. Leak and Sir William Lawrence, Bart.

## FIRST CLASS CERTIFICATE.

*Iris Wedgwood.*—This valuable *Iris*, which received an Award of Merit on January 27, 1925, is generally supposed to be a cross between *I. tingitana* and *I. Xiphium*. In general appearance it is a stately Spanish *Iris*, though larger and, of course, earlier in flowering, and it has the additional advantage in that unlike the Spanish type, the forced flowers do not become speckled, but retain their beautiful blue colouring. Large quantities of *Iris Wedgwood* are now forced for sale in Covent Garden and other flower markets. An illustration and account of this variety appeared in *The Gardeners' Chronicle* of February 7, 1925. Shown by Messrs. LOWE AND SHAWYER.

## AWARDS OF MERIT.

*Carnation Vesta.*—A very beautiful and fragrant, perpetual-flowering variety. The rounded, full flowers have broad, substantial petals which are prettily waved and broadly serrated. The colour is a rich rosy cerise, and the calyx is non-splitting. Shown by Messrs. C. ENGELMANN, LTD.

*Colchicum croaticum.*—As was stated on the exhibitor's card, this is one of the spring Colchicums which continue to flower over a considerable period. The flowers are about the size of the common *Crocus*, though slightly more pointed. They are paper-white in colour and have regular grey lines. On an occasional flower there was a suggestion of a rosy tinge. Shown by Mrs. DYKES, Bobbingcourt, Sutton Green, Woking.

*Crocus × chrysanthus Curlew.*—This is apparently a cross between *C. aurius* and *C. chrysanthus*. The flowers are yellow inside with a deeper glow at the base, while the exteriors have fairly broad, feathered lines of purplish-chocolate on a whitish base. Shown by E. A. BOWLES, Esq., Myddleton House, Waltham Cross.

*Crocus gargaricus.*—A very showy little species which produces several shining Buttercup-yellow flowers from each corm. It is said to be the only spring-flowering *Crocus* which bears its flowers in advance of the leaves. Also shown by E. A. BOWLES, Esq.

## GROUPS.

A very pleasant spring garden was made by Messrs. JAMES CARTER AND CO. near the entrance. A smooth, green lawn of velvety texture and enviably free from weeds was restrainedly planted with *Crocuses* in various colours. Behind the level lawn a gentle rise, planted with batches of *Crocuses* and *Snowdrops*, giving place to dwarf *Heathers*, had a background of *Conifers* and other shrubs.

Spring flowers in pots, vases, and also planted out in fibre were also attractively shown by other exhibitors. The CENTRAL GARDENS SUPPLIES had attractive breadths of *Crocuses*, *Primroses*, with *Ericas*, against a dark green background. Messrs. J. CHEAL AND SONS attractively grouped *Crocus versicolor* and also *Crocus Sieberi* with *Iris reticulata*, and also had good examples of various *Saxifragas*, such as *Saxifraga Irvingii*, *S. kestoniensis* and *S. Stuartii*. Mr. G. W. MILLER staged many good *Primroses* and *Polyanthuses* with early

Tulips, while in a well-conceived little garden, Mr. F. G. WOOD successfully blended the different shades in a collection of Blue Primroses, and he also showed *Crocus versicolor* in appropriate surroundings.

A particularly good exhibit, arranged by Messrs. BARR AND SONS, included a collection of the fascinating dwarf Irises, of which the very best were *I. Elegance*, *I. Rosalie*, and *I. olbiensis Socrates*. *Dicentra spectabilis*, of grace and elegance, *Crocus Susiana*, *C. chrysanthus Warley* variety, and *C. Golden Yellow*, of very rich colour, were also of great attraction. At one end Messrs. BARR AND SONS staged some good Hyacinths.

Alpines were shown in an increased quantity. At present Saxifrages are the most numerous, and of this genus Messrs. TUCKER AND SON included *Saxifraga Mrs. Leng*, *S. Irvingii*, *S. Oribistii*, *S. Faldonside*, *S. Petraschii*, *S. Burseriana tridentata* and *S. kewensis*.

Mr. CLARENCE ELLIOTT had a collection of choice varieties in pots and pans. These included *S. Jenkinsae*, *S. Riverslea*, *S. kewensis rosea*, *S. Burseriana Gloria* and *S. Irvingii* in flower, while there were fascinating little tufts of various crusted species and varieties.

In the front of a large collection of shapely little Conifers, Mr. G. G. WHITELEGG displayed pans of alpines, principally good Saxifrages. Messrs. WM. CUTBUSH AND SON made an attractive rock garden of bold design, and planted it with suitable quantities of *Iris Sind-pers*, *I. reticulata*, *Scillas* and *Primroses*. In the background there were *Rhodoras*, *Viburnum Carlesii*, *Ericas*, *Wistaria sinensis*, *Andromeda Polifolia* and other shrubs.

In a collection of interesting shrubs and alpines Mr. G. REUTHE included a cone-bearing branch of the rare *Abies Webbiana*, and sprays of *Abies religiosa*, *Pinus teocote* and other Conifers. He also showed *Camellias* and *Ericas*. Messrs. L. R. RUSSELL, LTD., had a very showy group of forced shrubs. There were floriferous bushes of *Prunus triloba fl. pl.*, *Forsythia spectabilis*, *Camellias* and *Azalea indica* varieties in quantity.

Cut sprays of *Rhododendrons*, shown by Messrs. GILL AND SON, included a large quantity of brilliant trusses of *R. Columbia*, with *R. arboreum* varieties, *R. nobleanum album* and many sprays of *Erica lusitanica*. With the *Rhododendrons* they grouped vases of their fine strain of *St. Brigid Anemone*. Mr. F. KLINKERT again showed good Topiary specimens in Box and Yew. Fresh Violets were shown by Miss E. HEATHCOTE and Mr. J. J. KETTLE. The variety *Princess of Wales* was represented by large and fragrant flowers, while Mrs. Lloyd George and the deep pink *Cour d'Alsace* were also freely shown.

*Cyclamens* of first-rate quality were staged by Messrs. PUTTRIDGE, LTD., and Messrs. BLACKMORE AND LANGDON had large plants of an equally good strain in such varieties as *Scarlet King*, *Giant Crimson* and *Salmon King*. Opposite their superb collection of vegetables, Messrs. SUTTON AND SONS displayed a small collection of excellent *Primulas*. The large-flowered sorts included *Etna*, of vivid colouring, *Royal White* and *Reading Blue*, while the graceful *Stellata* varieties were represented by *Coral Pink*, *Giant White Star* and *The Duchess*.

Sir WILLIAM LAWRENCE, Bt., sent from his famous garden at Burford, particularly well-grown plants of *Correa Harrisonii*, *Acacia Drummondii* and *Prostanthera rotundifolia*.

Carnations were staged in good, fresh colours by the usual exhibitors. Messrs. STUART LOW AND CO. included vases of *Eileen Low*, *Ruby Glow*, *Topsy* and *Fragrant Rose*. The chief varieties shown by Messrs. ALLWOOD BROS. were *May Allwood*, *Edward Allwood*, *Topsy* and *Laddie*. Messrs. C. ENGELMANN, LTD., had vases of *Maine Sunshine*, *Zorro* a *Fancy* of uncommon colouring, and *Doreas* and *Brend* of rich colours.

Probably for the last time this season, there were the usual collections of paintings of garden flowers and garden scenes. Besides these there was a valuable exhibit of water-colour paintings of *Pears* and *Plums* by Miss FRANCES BUNYARD. These were exceedingly faithful representations, and, especially in the *Plums*, Miss BUNYARD successfully portrayed the bloom on the fruits.

A large exhibit of coloured photographs, by Messrs. MALBY AND CO. was also of great value and interest. This exhibit included many subjects, of which probably, the newer *Roses* attracted most attention, though all were admirable.

#### Narcissus and Tulip Committee.

Present: Mr. E. A. Bowles (in the chair), Mrs. Brodie, Mr. G. W. Leak, Mr. Wm. Poupart, Mr. Chas. H. Curtis, Mr. J. Jones, Mr. W. B. Cranfield, Mr. G. Churcher, Mr. F. Secret, and Mr. Simmonds (Secretary).

#### AWARD OF MERIT.

*Narcissus March White*.—A fine, bicolor Trumpet variety; the trumpet being of soft sulphur-yellow. The award was made for forcing for market. Shown by Messrs. R. H. BATH, LTD.

#### GROUP.

The only collection of *Narcissi* was arranged by Messrs. R. H. BATH, LTD. This included large vases of the Trumpet *Daffodil March White*, which received an Award of Merit. Brightness, a good *Barrii* variety, and *Henry Irving*, yellow Trumpet, were extensively shown, and there were vases of *Darwin Tulips*.

#### Fruit and Vegetable Committee.

Present: Mr. C. G. A. Nix (Chairman), Mr. W. H. Divers, Mr. P. C. M. Veitch, Mr. George F. Tinley, Mr. John Basham, Mr. P. D. Tuckett, Mr. E. Neal, Mr. W. Poupart, Mr. A. Poupart, Mr. J. C. Allgrove, Mr. F. Jordan, Mr. A. Smith, Mr. J. Cheal, Mr. H. S. Rivers, Mr. E. Beckett, Mr. A. Metcalfe, Mr. J. Wilson, Mr. J. Weston and Mr. A. N. Rawes.

#### GROUPS.

Messrs. SUTTON AND SONS showed a collection of vegetables comprising 150 distinct kinds and varieties. This exhibit was displayed with great skill, many of the dishes being arranged on stands, and some on shelving, on a ground of black velvet, the clever disposition of the variously coloured subjects making a harmonious colour scheme. The quality was exceptionally fine in every case, demonstrating the excellence of the strains sent out by this famous seed house. At the back were arranged pyramids of such fine Broccoli as *Winter Mammoth*, *Early White* and *Christmas White*, the quality of the last being extraordinarily fine. Leeks, also of the largest exhibition size, showed up conspicuously with splendid Celeries, Dwarf Blood Red Pickling Cabbages and *Kales* with variegated foliage. Prominence was given, in the foreground, to immense Onions of the Selected *Ailsa Craig* type, and a selection of the firm's Onion numbered 94. Potatoes included most of the best sorts in cultivation. Improved Hollow Crown Parsnips, Matchless and Fillbasket Brussels Sprouts, Earliest Purple Kohl Rabi, and A.I. Tomatoes are deserving of special mention. There were excellent dishes of Mushrooms, Beets, Seakale, Shallots, Garlic, Endives, Asparagus, Turnips, Lettuces and other popular vegetables.

Messrs. DOBBIE AND CO. showed eighteen varieties of Potatoes that had been placed in cold storage, the excellence of the tubers showing that this treatment is adaptable for the preservation of Potatoes in the best condition late in the season. The sorts included *Great Scot*, *Catriona*, *Arran Comrade*, *Majestic*, *Arran Rose*, *Mauve Queen* and *Kerr's Pink*.

Mr. J. C. ALLGROVE displayed seventy-two varieties of Apples and Pears. The quality and extent of this exhibit were the subject of much comment, for 1926 was a notoriously bad fruit year, especially for Apples. Yet the quality was superb, and the use of a white ground and decoration of Palms, *Panicum*, *Selaginella* and *Aglaonema costatum* added to the effectiveness of the group. Outstanding varieties of Apples were *Bramley's Seedling*, *Lane's Prince Albert*, *Newton Wonder*, *Ontario*, *Bismarck*, *Annie Elizabeth*, *Wealthy*, *Golden Noble*, *Lord Derby*, *Barnack Beauty*, *Baxter's Pearmain*, *Cox's Orange Pippin* and *Hoary Morning*. Pears included excellent fruits of *Doyenné d'Allencourt*, *Bellissime d'Hiver*, *Olivier de Serres*, *Catillac*, *Josephine du Malines*, and *Duchesse de Bordeaux*.

Messrs. S. RIVERS AND SON showed trees bearing Oranges, Lemons and other Citrus fruits, also many gathered fruits of the same, the whole exhibit being very interesting and educational. The best fruited trees were *St. Michaels* and *Dulcissima Oranges*. The choicest of the gathered Oranges were *Sustan*, *Long Orange*, *Thomson's Improved*, *Navel* and *Egg Orange*. Citrons (*Citrus Medica*), Limes, Sweet Limes, White Lemon and Shaddock (*Citrus decumana*), were all shown well.

#### ANNUAL MEETING.

THE annual meeting was held at 3 p.m., in the Lecture Room. There was a large attendance, and many who were unable to enter the room crowded about the doorway. The chair was taken by the President, Lord Lambourne, and he was supported by the members of the Council. After the minutes of the last annual meeting had been signed, and one-hundred-and-fifty-seven new Fellows elected, his Lordship proceeded to comment on the Annual Report of the Council for 1926. He started by facetiously observing that they hoped to meet in the new Hall in a year or two, for Mr. Musgrave had already let a good many of the rooms, and he caused amusement by stating that he welcomed them at the annual meeting for the 123rd time. He was glad to inform the Fellows that the Society had moved forward in a very pleasing way, thanks to the efficiency of the Council and officers, and also to the spread of the love of gardening. His Lordship referred to the loss of prominent members of the Society, especially mentioning the late Sir George Holford, Professor W. Bateson, Rev. J. Jacobs, and Mr. J. F. Bennett Poe. He stated that progress with the new Hall was entirely satisfactory, and that there was every prospect of the contractors fulfilling their undertaking to have the building completed by May, 1928. They had no doubt they would be able to fill every inch of the hall and be better able to accommodate the kindred societies.

He was glad to know that the shows had been successful; no fewer than 100,000 people visited the Chelsea exhibition. In order to make for the greater convenience at that show the Council had leased an additional piece of ground, which would serve to accommodate tents for tea and a band. This year there would be a private view of the show for the Fellows from 9 a.m. till 12 noon. Lord Lambourne stated that two new shows had been added to the Society's programme, and referred to the near completion of the Catalogue of the Lindley Library and Pritzel's *Iconum*; with reference to the last work he said the entries already numbered half-a-million. In moving the adoption of the Report, Lord Lambourne said the Council looks forward to even greater prosperity in the future.

The adoption of the Report was seconded by Sir William Lawrence, who proceeded to give some details of the Balance Sheet. He said the financial statement contained a few new features; for example, there was now an entry on account of ground rent of the new Hall, and an increased cost of painting the certificated plants. The cost of the revision of the Pritzel's *Iconum*, although not entirely settled, would only mean a small sum in the future, but constant revision would be necessary. The roof of the Hall had been re-glazed at a cost of £2,500, but that had been met out of the account put aside for depreciations. They had built six new cottages at Wisley, made there one of the best Alpine houses in the country, and incurred further commitments in appointing a Keeper of the Gardens, and were now about to appoint a Keeper of the Laboratories for conducting research work, and extending the training of the students. They had invested funds of some £44,000, and a general reserve fund of £80,000. The certificates of the Architects in respect of work completed on the new Hall amounted from £7,000 to £10,000 a month. The Society was completely solvent.

He concluded by saying that the success of the Society was, in a great measure, due to their excellent President, and their chief watch-dog, Mr. Frank Reader, the Cashier, the mention of whose name evoked much applause.

The appointment of the President, Council and Officers was carried without comment, and the President then proceeded to hand the medals and other awards made by the Council: the Victoria Medal of Honour in Horticulture (the highest honour the Council can confer), to Mr. H. G. Alexander, Mr. W. W. Pettigrew, Mr. Alfred Watkins, Mr. W. E. Wallace, Mr. C. T. Musgrave, Mr. R. L. Harrow and Professor Theobald; the Gold Veitch Memorial Medal to Mr. Henry B. May, V.M.H., and to Mr. James Hudson, V.M.H., for life-long services to horticulture; to Mr. George Forrest, for his explorations and introductions; and to Rev. G. H. Engleheart, for his work on Daffodils. The Silver Veitch Memorial Medal and £25 was awarded to Mr. W. Camp, who was, unfortunately, too indisposed to be able to attend but was represented by his son; and a similar award to Miss Matilda Smith, the famous botanical artist who, alas! died a few weeks after the Council decided to confer this honour upon her. Dr. Hill, of Kew, agreed to convey the Medal to the sister of the deceased lady.

Other awards were the Moore Medal, won curiously enough by the donor, Mr. G. F. Moore, for his *Cypripedium* Sir Trevor—the finest *Cypripedium* of 1926. Mr. Leak received the Lawrence Medal on behalf of his firm, Messrs. R. H. Bath, Ltd., whose Daffodil exhibit on April 7, was considered the best of the year. Mr. Hay agreed to forward the Cory Cup to Mr. F. Howard for the bigeneric hybrid *Crinodonna Memoria-Corsii*, the best new plant shown at R.H.S. meetings in 1926. Unfortunately, Mr. Lionel de Rothschild could not be present to receive the beautiful Loder Cup awarded to him for his work in furthering all movements for the introduction and cultivation of *Rhododendrons*.

Mr. R. Fife rose to ask "whether the special judges appointed to recommend awards in the case of Rose trials now being conducted at Wisley made any recommendations, and if so, what is the nature of them, and are they likely to be given effect to?"

Mr. F. J. Chittenden, Director of Wisley Gardens, said the recommendations had been acted on, and Mr. Fife asking to what extent, elicited the reply from Mr. Chittenden: "As far as possible."

Mr. Fife said he was not satisfied with the answer, and he moved: "That the special trial of Roses now being conducted at Wisley be abandoned."

He said he was strongly in favour of competitive trials provided they were carried out on suitable soils, for all benefited by a proper trial of any plant. He advocated last year that the Rose trial should be scrapped, for the Roses were planted in soil that was unsuited to them, and they made little growth, while disease had been rampant. Roses, he said, cannot be expected to grow in sand. His only object in raising the point was to state the facts to the Council and Fellows. He saw the trial so recently as Saturday, the 5th inst., and he determined to bring the matter before the meeting in the interests of horticulture and the Society.

Mr. E. Charrington seconded, considering the suggestion a wise and sensible one. Mr. W. Easlea moved an amendment to the motion. He said the first plantation of Roses had been a great success, and it seemed as if Mr. Fife had a grudge against Wisley. He, Mr. Easlea, had been a juror of the trials since the commencement, and as one who had thirty to forty years' experience in growing Roses, he considered the Roses had made splendid growth. The other part of the Rose garden could be made suitable by cultivation and manuring. The trial garden should be extended right and left, and if the ground was prepared in spring, allowed to lie fallow all the summer, and planted in the autumn, the Roses would succeed. A point he stressed was that Roses entering the trial from the Continent should be disinfected, as many were badly diseased.

The amendment was seconded by Mr. A. Wood.

After further discussion, Mr. R. Wallace stated that Mr. Fife had asked what the recommendations of the judging committee were, and could Mr. Chittenden give them. Mr. Chittenden was understood to say that the recommendations of the judges had not come

before the Wisley Committee. He tried to prove that the trials having shown which were the best Roses out of some five hundred, had served their purpose, and pointed out that there was a vast difference between a Rose trial and a Rose garden, and that the varieties selected from the Rose trials by the judges as being most suitable for garden decoration had been a great success when planted in the Rose garden at Wisley.

Mr. Fife did not appear to be satisfied; the discussion was brought to an end by the President who assured Mr. Fife that the matter would receive the earnest consideration of the Council.

A vote of thanks to Lord Lambourne for presiding brought the meeting to a close.

### NATIONAL CHRYSANTHEMUM.

In the absence of the President, Mr. E. F. Hawes occupied the chair on the occasion of the Annual General Meeting of the National Chrysanthemum Society, held at Essex Hall, Strand, on Monday evening last. The attendance was small, only twenty being present, but this was not surprising considering the atrocious weather experienced throughout the metropolitan area on that day.

The principal business was the presentation of the Report of the Committee and the Statement of Accounts for 1926. These were read by the Secretary. The Report stated that the Floral Committee had considered the merits of no fewer than one hundred-and-twenty novelties during the past year, and awarded thirty-seven First-Class Certificates and three Commendations. Decorative and Single varieties were those that found most favour. The exhibition held at Westminster in November was a good one, but not quite so good as some of its immediate predecessors, and the attendance showed some reduction owing to the inclement weather of the second day. The Committee tendered grateful thanks to Sir Jeremiah Colman, Bart., for his generous interest in the Society during his three years' Presidency, and it endorsed the nomination of Sir John Ward as successor to Sir J. Colman. Thanks were also offered to Mr. Falkner and Mr. B. Carpenter for special services rendered. Sympathetic reference was made to the losses sustained by the deaths of Mr. Harry Woolman and Mr. T. W. Sanders, two enthusiastic friends of the Society.

The accounts showed £100 12s. 6d. received as subscriptions; £23 17s. 6d. for affiliation fees; £79 for special prizes; £80 4s. 0d. income from takings at the show, sale of tickets and entry fees; and £25 8s. 6d. for medals; there were other items making a total of £362 5s. 7d. On the expenditure side printing and stationery come to £35 18s. 9d.; medals, cups and engraving, £47 7s. 3d.; prizes, £124 18s. 6d.; show expenses, including hire of the Royal Horticultural Society's Hall, etc., £22 12s. 6d.; Secretary, £50. The total expenditure amounted to £296 7s. 11d., leaving a balance at the bank of £65 17s. 8d. The Society has also a reserve fund of £100, and the balance sheet showed a surplus of assets over liabilities amounting to £192 4s. 8d.

The Chairman, in moving the adoption of the Report and Audited Accounts, briefly reviewed the principal items of the Society's work; this was seconded by Mr. Runcieman and carried.

The election of officers and Committee was then proceeded with. The Hon. Sir John Ward was unanimously appointed President; Mr. D. Ingamells, Treasurer and Vice-Chairman; Mr. E. F. Hawes, Chairman of Committee; Mr. Charles H. Curtis, Secretary and Editor; and Messrs. Witty and Bayly, Hon. Auditors. The eligible retiring members of Committee were re-elected, and Mr. Vinten, Mr. Connor and Mr. J. Woolman were elected to fill vacancies arising.

Thanks were accorded Sir Jeremiah Colman, the officers and Committee, and the Auditors for services rendered.

At the conclusion of the general business, Mr. D. B. Crane gave a very interesting address on "Old-time Chrysanthemums." He had been at considerable pains to prepare his subject, and all present regretted the small attendance to hear him. Mr. Crane reviewed the work of such raisers as Mr. R. Owen, Messrs. Drover, Mr. Weeks,

Mr. Nicholson, Mr. M. Silsbury, Mr. Charles E. Shea, Mons. Calvat, Mr. Pockett, and others, and the earlier work of Mr. Godfrey, Mr. N. Davis, and Mr. H. J. Jones. The names of varieties once famous on the show boards brought to the minds of the older members present many interesting events in Chrysanthemum history of a quarter-of-a-century or more ago, and by comparison with modern varieties, these served to show the wonderful improvements made.

Mr. Stevenson pointed out that some of the old varieties mentioned were still grown largely for cut flowers for market, and stated that the incurved variety Charles H. Curtis was one of those most extensively grown in the United States for the cut-flower trade. A cordial vote of thanks was passed to Mr. Crane for his address, and a similar vote to the Chairman concluded the proceedings.

### Obituary.

**Charles Vuylsteke.**—We have to mourn the passing of yet another veteran of the horticultural world—the celebrated orchidophile, M. Charles Vuylsteke, of Loochristy, Belgium, one of the foremost of the pioneer hybridists of the nineteenth and early twentieth centuries. Born in 1844, young Vuylsteke worked under his father in the houses at the Château de Loochristy at an early age, and at fourteen was already an idealist in horticulture, longing to produce only what was best and most beautiful among the fruits which were then his favourite subjects. At twenty, his attention was turned to the cultivation of Azaleas and *Rhododendrons*; and still pursuing his early ideals of beauty in form and colour, he produced some new varieties which are still cultivated and appreciated for their good qualities. Eight or nine years later, still seeking fresh outlets for his boundless energy and unsatisfied creative instincts, he began to devote himself to the cultivation of Palms, Araucarias and *Amaryllis*, obtaining seeds from Australia, Brazil, the Sandwich Isles and elsewhere in the hope of discovering new and beautiful forms. Disappointments were bound to occur, but Vuylsteke was not discouraged, and managed in time to establish an exchange system with a number of the best botanic gardens, on whom, for the seeds they sent him, he bestowed choice and welcome plants of *Begonias*, *Pelargoniums*, etc., from his nursery. In 1878, the nursery he had owned for a number of years, appearing to him too small for his still undiminished energies, he bought new ground which he occupied until his death, and which, with late additions, extended finally to ten hectares. Some years after this, still seeking "new worlds to conquer," he imported from Columbia some cases of *Odontoglossums*, probably little guessing the important part they were to play in his subsequent career. He gradually became more and more absorbed in the cultivation of Orchids, and in 1892, obtained two or three seedlings of *Odontoglossums*, hybrids of *O. grande* var. *Leopardinum* × *O. crispum*—a success which formed an epoch in Orchid cultivation, and from which Vuylsteke never looked back, devoting himself heart and soul to this new and fascinating occupation. In 1898 he exhibited in England a plant which caused a sensation—a hybrid between *O. Pescatorei* and *O. Harryanum*, which he dedicated to Mr. Rolfe, and in 1899, at the Mont-St.-Amand, exhibition in Belgium, he showed, in a glass case, the hybrids obtained up to that date, which were the admiration of all who saw them, and which won for him the Grand Prix d'Honneur. From this triumph he may be said to have gone on from strength to strength, and at every exhibition of importance his hybrid Orchids had pride of place. The Ghent Florales of 1923 saw the culminating point of his career; no one who saw his exhibit at that show can possibly forget the superb mass of glorious blossoms, all of his own raising, all perfect of their kind, but of a bewildering diversity of form and colour. He had received many honours, including the Order of Leopold, Order of St. Stanislas, *Mérite Agricole* of France, and *Légion d'Honneur*.

REMARKS.—All white blooms are gradually becoming dearer. A few white Chrysanthemums are still available at high prices; the only varieties on offer are Cheshunt White and Favourite. Coloured varieties are practically finished. All Daffodils have been firmer in price, but more varieties are on offer, including Golden Spur, Henry Irving, princeps, King Alfred, Sir Watkin and Victoria. Larger Supplies of Narcissus ornatus and Narcissus Primo

have been received, but prices for these flowers remain firm. All Tulips are arriving in fine condition and their prices are similar to those of last week. More double varieties are on offer, such as Lucretia, Tea Rose and Vurbank. A few Darwin Tulips are beginning to arrive in good condition; William Pitt, Bartigon and Wm. Copland are the best so far received this season. Prices for all Liliums remain firm for the supplies are still limited. More Dutch White Hyacinths are on sale in good condition. Roses are practically absent from the market; only a few blooms of Columbia and Madame Butterfly are obtainable by placing orders in advance. Blooms of the new crop of red Roses are expected in the market in a few days. The supplies of Snowdrops and Violets are more than sufficient for present requirements. White Freesias with long stems meet with a good demand. Supplies from the Channel Islands are increasing almost daily; more Daffodils, white and yellow Narcissus are on offer, and the prices for these flowers are on the down grade. Supplies from France are receiving more attention, and business generally is good in this department; Paper-white Narcissus, Acacia (Mimosa), Violets and Anemones are most in demand.

## GLASGOW.

Price movements in the cut flower market displayed a little irregularity, but the changes were small and mostly in a downward direction. Fortunately, the supplies were moderate, and owing to the high prices ruling at Covent Garden, small quantities are being directed north. Special blooms of William Copland and Tea Rose Tulips made up to 1/3 and 1/9 respectively for 6's, while William Pitt was obtainable at 1/2 to 2/3. Other varieties were sold as follows:—Thomas Moore, La Reine and William Copland, 9d. to 1/-; Ibis, Flamingo and Couronne d'Or, 1/- to 1/4; Tea Rose, 10d. to 1/-; Muriilo, 10d. to 1/4; Rosini, 1/4 to 1/7; Bartigon, 1/6 to 2/-; Lucretia, 1/4 to 1/9; and double yellow, 1/3 to 1/6. Daffodils were cheaper, King Alfred being worth 1/4 to 2/3 (12's); Golden Spur, 10d. to 1/2; Pheasant Eye, 10d. to 1/-; and French Narcissus, 3/- to 5/- per dozen bunches. Roses were scarce and very dear, averaging 14/- to 15/- per dozen. Chrysanthemums were restricted to Heston White at 6d. to 9d. per bunch. Prices of Lily-of-the-Valley and Lilac ranged from 1/6 to 1/9; Carnations, 3/- to 4/- per dozen; Violets, 1/- to 1/6; Snowdrops, 6d. to 2/6; Smilax, 1/- per bunch and Asparagus, 9d. to 1/6.

In the fruit section oranges advanced in price, and Apples were also dearer. Jaffa Oranges (144's) ranged from 13/6

to 17/6, 180's 20/- and upwards; Valencia 300's, 18/- to 22/-; 240's, 23/-; 420's, 36/-; and 714's, 30/-; Palermo Lemons (300's) fluctuated between 11/- and 13/-; and Murcia (same counts) made 18/- to 20/-. Washington Winter Nells Pears averaged 16/6 per half-case; English Gros Colmar Grapes made 4/- to 5/- per lb. Large quantities of South African fruits are arriving in first-class condition and realising the following prices:—Santa Rosa Plums, 45's and 50's, 6/- per tray; 55's, 5/6; 60's, 5/-, and 65's, 6/6, 4/6. Wickson Plums, 5/- to 6/6, according to counts. Peaches Early, Early Rivers and Duchess of York, 25's, 6/6; 28's, 5/-, and 32's, 4/-.

Trade in vegetables is quiet. Lettuces made 7/- to 9/- per crate; Radishes, 3/6 per dozen bunches; Syboes, 7d. to 9d. per bunch; Rhubarb, 30/- to 34/- per cwt; Tenerife Tomatoes, 24/- to 32/- per bundle, and Mushrooms, 2/- to 2/6 per lb.

## ANSWERS TO CORRESPONDENTS.

ALLOTMENT LAND.—W. J. C. If, as we assume is the case from your letter, your allotment is cultivated by you wholly or mainly for the production of vegetables or fruit crops for consumption by yourself or your family, a six months' notice expiring on the 1st April is valid, and no compensation is payable by the landlord for disturbance, crops or manure. If, however, the allotment is cultivated wholly or mainly for the purpose of the trade or business of market gardening, the position would be different.

DRESSING WOUNDS IN TREES.—G. N. H. A fairly strong paraffin emulsion painted on the bark of trees would kill most insects that were brought into contact, but it should be kept away from all buds. We should not recommend paraffin as a dressing for wounds on the fruit trees, but should prefer to use Stockholm tar. The simplest means of liquifying the tar is by the application of heat.

GRUBS ATTACKING BEGONIA AND CYCLAMEN BULBS.—H. W. The grubs were very dried out when they reached us, but they are certainly grubs of a "weevil." Weevils form a large group of beetles characterised by long snouts. This particular one may have been the grub of Otiorynchus. This genus is a common pest in greenhouses as well as in the outside garden. Its grub spends the late summer, autumn and winter in the soil, feeding on roots or tubers. In the spring it pupates and comes out as the adult beetle. It is almost entirely a night feeder and will probably pass unnoticed unless sought for during the night. The use of clean compost would not help matters much, as infection either by eggs or grubs would still remain. Fumigation has probably taken place when the insect was underground and out of reach. Naphthalene in some proprietary form might act as a deterrent, but this material would be unlikely to kill the pests. An effort should be made to deal with the adult stage, which will probably appear sometime between March and May. Search should be made at night, and if found, the house should be fumigated with cyanide by one of the usual methods. If preferred, the attacked plants may be sprayed with lead arsenate at the rate of one-and-a-quarter ounce of paste to one gallon of water, or the beetles may be collected by hand at night. The last method, however, is laborious, and usually unsatisfactory.

PRUNING RAMBLER ROSES.—H. W. As the pruning of rambler Roses at this season generally consists in removing old growths in their entirety, no harm is likely to accrue if the work is done in frosty weather but, as a rule, it is not wise to prune shrubs of any sort during hard frosts. The Hawthorn hedge may safely be pruned now except during very severe weather. The principal work at the moment in a neglected garden would consist of manuring and digging all vacant sites, pruning fruit trees, transplanting shrubs, and any needed repairing of the garden paths.

## WILLIS BROS.' Garden Fertiliser

### THE BEST ON THE MARKET.

**NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing for Kitchen Garden or Herbaceous Borders. 1 cwt., 15/-; ½-cwt., 9/-; 25 lb. 5/-; £14 10s. per ton. All Carriage Paid.

### VINE BORDER COMPOUND.

Supplied in two grades. Coarse, for New Borders. Fine, for renovating Old Borders. 1 cwt., 25/-; £24 per ton; Carriage Paid. For New Vine Borders: to each cart-load of good fibrous loam, add ½-cwt. Compound and one bushel Stick Charcoal, and mix thoroughly. For renovating Old Borders: remove as much as possible of the surface soil without damaging the roots, and mix ½-cwt. Vine Border Compound with each ton of good fibrous loam.

### CHARCOAL.

Best Wood Charcoal, in sticks, 8/- bush., 14/6 5-bush. sack.  
Fine Dust Charcoal, 8/- bush., 14/6 5-bush. sack.  
Bags included, Carriage paid.

### PURE HORTICULTURAL BONE MEAL:

For Vine Borders, Potting and General Horticultural Purposes.  
Best English Bone-meal, 17/6 per cwt., £17 per ton. 1", 1" and 1" Bones, 18/- cwt., £17 10s. ton, carr. pd. These bones are prepared by a special process. all the fatty insoluble matter being extracted, which renders the bones more soluble without destroying the nitrogenous matter. Analysis: 44/5% Ammonia; 45/50% Phosphates.

### NEW HESSIAN MATS.

9ft. x 4ft. 6in., 8/- each; 85/- dozen; carr. paid.

### NEW RUSSIAN MATS.

Light, 17/6 per dozen, carriage paid.  
Heavy, 21/- per dozen, carriage paid.

### GARDEN SUPPLIES AT LOWEST PRICES.

Write for our List of Garden Manures and Horticultural Sundries. Free on application.

**WILLIS Bros. (HARPENDEN) Ltd.**  
HARPENDEN, HERTS.

## BLACK CURRANT

is the most profitable crop for large or small growers. EDINA is the best for sturdy growth, finest and largest fruit, best selling, heavy and regular cropping, and most resistant to big bud. For over 25 years my stock has always been and is entirely free from big bud.

Raised and now offered by:

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

## SITUATIONS WANTED

Twenty words **2s.**, and **6d.** for every succeeding eight words or portion thereof. (Advertisement, at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, **1s.** over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

O f a r i p e  
o l d a g e

Between the Regency and the early Victorian eras at a period when little or nothing was known about such things as Glasshouses, the firm of William Duncan Tucker & Sons, Ltd., was founded.

\* \* \*

Fewer crafts require such delicate and skilful labour as the erecting and repairing of these structures. If, therefore, you are an owner or a prospective owner of

a Glasshouse it will pay you to appeal to the experts for assistance.

\* \* \*

William Duncan Tucker & Sons, Ltd., are experts—specialists. Ever since 1830 they have been steadily gathering Glasshouse knowledge and experience. Their business now embraces both creative and repair work in every shape and form. Get into touch with them.

# RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

## SUPPLEMENT PLATE.

Eueryphia pinnatifolia.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 39° 9'.

ACTUAL TEMPERATURE—  
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, February 16, 10 a.m. Bar. 30.5. Temp. 44°. Weather, Misty.

SCIENCE in the early days of its development charms us by the seductiveness of simplicity; but as it

matures, though we may still admit the charm, the simplicity is seen to be illusory. It is a very complicated world we live in, and science, sooner or later, finds it out. Reflections of this kind are inevitable to anyone who reads Dr. Brechley's recently published edition of Plant Poisons. What is a plant poison? Is it anything that may injure it? Then every "plant food"—salts of nitrogen, potash salts or phosphates, without which no plant may live, may be shown to act poisonously upon occasion. Thus any one of these essential food materials if associated with due proportions of the others, acts beneficially, but an equal quantity of it may, if unaccompanied by the others, act as a poison. Furthermore, ordinary plant poisons, arsenical copper and other compounds are not all alike in their

action on plants. Some, viperously inclined, exercise their poisonous effect even when supplied in exceedingly minute quantities, and if the concentration in the soil becomes yet further reduced, end by producing no effect on the plant; impotent now from evil they cannot yet do good. Other poisons, however, though ordinarily inimical to plants, become, as it were, converted from enemies to friends by the simple process of dilution. In other words, though they are poisons even in very dilute solutions, they become actually helpful to the plant when they are supplied to it in solutions yet more dilute. How sensitive are plants to the action of poisons may be judged from figures given by Dr. Brechley. One part of copper sulphate in one million stops all growth in Barley. This, however, occurs only if the plant lacks the encouragement provided by nutrient salts, for if the latter are present, a solution of copper sulphate four times as strong fails to stop growth, and only succeeds in retarding it. Of substances which are both toxic and stimulatory, manganese provides an interesting example. It is easy to show that salts of this element may retard growth and yet there is a wealth of evidence to show that in certain concentrations and in certain plants manganese acts as a stimulator. So markedly is this so that the use of manganese salts has often been recommended as a means of increased crop-production. Wheat, and root crops such as Potato and Sugar Beet are said to respond kindly to small dressings of manganese fertilisers. But of all inorganic plant poisons boron is perhaps the most interesting. That it may exercise disastrous effects on crops was discovered by American growers during the war. As Dr. Brechley points out, the wide-spread injury which Maize, Potato and other crops sustained in the United States was traced to the use of potassic fertilisers, which for some reason or another contained about 1.63 per cent of borax. The leaves of the plants treated with this impure fertiliser turned yellow, the crops failed, and the vendors of the fertilisers had to pay compensation. And yet, as Dr. Brechley herself has shown, boron, if applied in small quantities, appears to exercise a beneficial effect on many crops, and still more remarkable, seems to be essential for the proper development of certain Leguminous crops—Peas, for example. Grown without any trace of boron, Peas fail to develop properly. The root nodules are few and relatively puny, but a trace of boron restores them. The root nodules grow vigorously, nitrogen fixation is accelerated, and therefore it is not unreasonable to claim that boron must be added to the list of mineral substances which are essential to plant growth. In the light of such facts as these it must be admitted that there be more things in heaven and earth than are yet writ down in our philosophy!

**Our Supplement Plate.**—With this issue we present our readers with a supplementary illustration of the beautiful *Eueryphia pinnatifolia*. On January 15 we published an illustration (Fig. 29, p. 51), showing a life-sized spray of flowers of this Chilean shrub, to which the present reproduction will form a pleasing and useful companion. The plant now figured is, in its season, one of the attractions at the Royal Gardens, Kew.

**Presentation to Mr. W. W. Pettigrew, V.M.H.**—As a mark of their esteem and as a personal recognition of the honour—Victoria Medal of Honour of Horticulture—conferred upon their Superintendent, Mr. W. W. Pettigrew, five hundred members of the Manchester Parks and Ceme-

teries Department recently attended a meeting at which Mr. and Mrs. Pettigrew were each presented with a suitably inscribed gold watch as souvenirs of the occasion. In making the presentations, Alderman T. Fox, O.B.E., Chairman of the Manchester Corporation Parks and Cemeteries Committee, referred to the wonderful spontaneity of the response by the staff to the suggestion that some tangible evidence of their regard should be given to Mr. Pettigrew on the occasion of his receipt of the highest honour British horticulture can confer.

## Covent Garden Market Bill Withdrawn.

At an Extraordinary General Meeting of the Beecham Estate and Pills Co., Ltd., on the 16th inst., the Chairman, Mr. Edmund Spyer, stated that the Parliamentary Bill dealing with the proposed transference of the Covent Garden Market to the site of the Bloomsbury Foundling Hospital had been withdrawn. He stated that they had been strenuously opposed by those from whom they had expected support and it was useless trying to get the Bill through. The strong opposition was reflected in the large number of petitions against the Bill which included those from the Covent Garden Tenants' Association, the British Florists' Federation the Retail Fruiterers' and Florists' Association, the London and Professional Fruit Buyers' Association, the London County Council, the Holborn County Council, West Ham Corporation, the National Farmers' Union, Garden Committees of Brunswick and Mecklenburgh Squares, Chelsea Borough Council, Westminster City Council, L.M.S. Railway, G.W. Railway, L.N. Railway, Southern Railway, the Metropolitan Railway Company, Corporation of London, the Governing Body of Rugby School, the Royal Free Hospital and the St. Pancras Borough Council.

## Help for the Gardeners' Royal Benevolent Institution.

Another demonstration of the valuable assistance gardeners are able to render to the horticultural charities has come to our knowledge, and we gladly bring it to the notice of our readers, not only because it deserves publicity, but also in the hope that such publicity may encourage others to "go and do likewise." Mr. C. H. Cook, gardener to His Majesty The King, together with the garden staff at the Royal Gardens, Windsor, organised a whist drive and dance, which was held in the Guild Hall, Windsor, on February 10. Thirty-three tables were occupied by the whist players, and at the same time sixty-five couples danced in the Council Chamber to music provided by an excellent local band. When the prizes were distributed, Mr. C. H. Cook thanked those present for their attendance and help, and explained the work of the Gardeners' Royal Benevolent Institution. We understand that this charity will benefit to the extent of £40, and that Mr. Cook has been urged to organise similar functions at no very distant date.

## Effect of the January Hurricane in Northern Scotland.

A run through the devastated woodlands in the North of Scotland ten days after the hurricane of January 29, revealed to me, writes a correspondent, the considerable and widespread havoc wrought on many famous forests. Aberdeenshire, Banffshire, Morayshire, Nairnshire and Ross-shire—counties that have great reason to be proud of their magnificent timber—have all suffered grievously, and thousands of "monarchs of the woodlands," after surviving the blasts and storms of over a century, have been laid low. At Aberlour, Banffshire, the beautiful and finely-wooded demesne of Sir John Findlay, Bart., much havoc has been done, and thousands of trees blown down in the different woods. At what is known as The Triangle, the fine avenue leading from there to Aberlour House, marked evidence is shown of the wind's devastating fury by the great number of stately Spruce trees, many over a century old, that have been uprooted and broken. Passing on to the district known as "Bonnie Strathspey," where the woodlands are the most extensive and most valuable in Britain, whole areas of fine Larch and Fir trees have been levelled. In the Culreach

\* *Inorganic Plant Poisons and Stimulants*, by Winifred E. Brechley, D.Sc., Cambridge University Press, 1927. 10s. 6d. net.

and Balliefurth woods great damage has been wrought. The majority of the giant Beech trees in the avenue of Castle Grant, the ancestral home of the Earls of Seafield, crashed during the height of the gale. At Ballindalloch Castle the chief Scottish seat of Sir George Macpherson Grant, Bart., hundreds of trees were blown down in the main drive, and the woodmen will have their hands full there for some time to come. At Kingussie, trees which have stood the test of last century's gales were uprooted as if they were saplings. On the estates of Altyre and Relugas, too, considerable damage was done, many fine trees being cast down. In the fine woods of Gordon Castle, the chief Scottish seat of the Duke of Richmond and Gordon, a severe toll was taken, including several of the gigantic specimens within the Castle grounds, which were always a source of great admiration to visitors. The woodmen on the various estates will be occupied for weeks in removing the fallen timber, helped, no doubt, by the poor cottars and villagers in the respective areas, whom one can forgive crooning to themselves the old Scottish adage—"It's an ill win' that blows naeboddy guid." Fortunately, serious accidents to life and limb were few in the north and northeast, compared with the lamentable record in the south-west and midlands of Scotland. The gale at its height travelled along the "Great Fault," which seemed to act as a funnel, and geologists declare that the mountain range of the Grampians, which cross Scotland and run into the sea at Aberdeen, formed during the most trying period a bastion that considerably moderated the velocity of the wind in the northeast. Be that as it may, the velocity of the wind recorded at the Aberdeen Meteorological Station, King's College, was at times considerably over fifty miles an hour, but this was less than half the record—102 miles per hour—registered on the instruments at the Coats Observatory, Paisley, in the West of Scotland.

**Dombeya Cayeuxii.**—At the meeting of the Royal Horticultural Society held on January 12, 1926, a plant exhibited by Lord Glanely under the name of *Dombeya Glaneliae* was provisionally given an Award of Merit, subject to its being correctly named (see *Gard. Chron.*, vol. LXXIX, p. 53, and p. 63, Fig. 32). The Secretary of the Royal Horticultural Society now informs us that "it has now been definitely established that the plant is *Dombeya Cayeuxii*, a hybrid between *D. Mastersii* and *D. Wallichii*, first raised by M. H. Cayeux at Lisbon. It was described and figured in the *Revue Horticole*, 1897, p. 545." This finding is in accordance with the information received from M. Cayeux and published in *The Gardeners' Chronicle* of February 6, 1926, when D. Wallichii, one of the parents, and *D. Davaei*, another hybrid *Dombeya*, were figured.

**Acacia Hanburyana.**—When an error of omission or commission occurs in *The Gardeners' Chronicle*, whether due to the mischance of our contributors or ourselves, a correction is invariably forthcoming from one or more of our wide clientele of readers. In the case of *Buddleia Forrestii* and *B. Fallowiana* the unwitting error of a careful correspondent led to the discovery that the plant widely distributed and known under the first name was none other than *B. Fallowiana*. *Acacia Hanburyana*, described in our issue of January 29, and figured on p. 95, affords another instance of the ease with which an error may be made, and the fallibility of memory. On the authority of Mr. Braggins, we stated that *Acacia Hanburyana* was a natural hybrid (*A. Baileyana* × *A. podalyriaefolia*) that appeared many years ago at La Mortola; now comes a letter from Mr. Joseph Benbow, formerly Superintendent of the Gardens at La Mortola, confirmed by Commendatore Cecil Hanbury, M.P., stating that *Acacia Hanburyana* was raised some twenty years or so ago by the late Mr. Ludwig Winter, of Bordighera, Italy, who gave its parentage as *A. dealbata* × *A. podalyriaefolia*, and named it in honour of the late Sir Thomas Hanbury, the founder of the famous establishment at La Mortola. Mr. Ludwig Winter raised other hybrid *Acacias*, but none so beautiful as *A. Hanburyana*.

**A Viola and Pansy Society for the South of England.**—It will be of interest to many of our readers to learn that there has been formed The London and South of England Viola and Pansy Society. At its exhibitions there will be separate classes for bedding Violas as well as for varieties which are grown exclusively for exhibiting. One of the objects of the Society is to encourage raisers to produce Violas of short, tufted growth, suitable for bedding, which, with special cultivation, will produce blooms of good size for the show table. The first exhibition will be held on July 19, 1927, in connection with the R.H.S. Show, at Vincent Square. The minimum subscription to the Society is 2s. 6d. The Hon. Secretary is Mr. John H. Little, Brent Tor, Brentwood Road, Romford, Essex.

**Mr. William Kelway.**—It is with very great pleasure we are able to publish a portrait of Mr. William Kelway, the veteran horticulturist who retired last year from the proprietorship of the firm of James Kelway and Son, of

MR. WILLIAM KELWAY.

Langport, Somerset. Mr. W. Kelway is in splendid health, and notwithstanding his advanced age—he was born in 1839—he scorns the use of an overcoat even in wintry weather. His father, James Kelway, founded the business in 1851, and father and son made the name of Kelway famous in the horticultural world by their work in the improvement of *Gladioli*, *Paeonies*, *Pyrethrums* and other popular garden flowers. The present proprietor, Mr. James Kelway, is maintaining the traditions and extending the success of the business founded by his grandfather, and so ably conducted by his father over a long period of years.

**Contact Insecticides.**—At the next meeting of the Association of Economic Biologists, to be held at 2.30 p.m., on February 25, at the Imperial College, South Kensington, Mr. F. Tattersfield and Mr. C. T. Gimmingham will read a paper on "Laboratory and Field Experiments on Contact Insecticides."

**Flower Pictures at the Mansard Gallery.**—Quite a choice little collection of flower paintings has been brought together at the Mansard Gallery, 1926, Tottenham Court Road, W.1, and is to remain there until March 19. There are under a hundred pictures, mainly of a pleasing and unambitious kind, by modern, but not too modern, artists; the smallness of the exhibition makes for a pleasant intimacy and for the absence of that tendency to adverse criticism which springs from fatigue in the critic. A good general level of quality is maintained, but many of the subjects chosen are too

frequently employed by artists; *Anemones* and *Marigolds* have been seen in too many floral groups to attract attention unless treated in a very original style. "Summer's Farewell," by Anna Airy, shows late summer and early autumn blooms in a vase, while some dead *Roses* lie on the table beneath. The same artist's "Golden September" depicts a fruiting branch of *Plums*, both leaves and fruits considerably disfigured by the attacks of caterpillars; a well-executed piece, but not very decorative. A more conventional picture in the same style is a branch of *Apple blossoms* against a blue sky, by E. C. Austin Brown. Unusual subjects pleasingly treated are *Nemesias* in a blue vase, and pink-mauve *Mallows* in a glass jar against a deeper mauve background, the green leaves throwing up the main colour; these are by Miss E. B. Dawson. Miss Gluck's *Camellias* and *Snowdrops* make two decorative studies in dead white against a dark background, and Cedric Morris' Mourning *Irises*, though a little sombre, are sympathetically done. There are several wood engravings, among which we especially noticed Miss Lily Blatherwick's "February Fairmaids," and John Platt's "Red Chestnut," a colour wood-cut depicting a cat lying in the bough of a flowering Chestnut tree, greedily watching two birds soaring in the air above.

**Presentation to Dr. Borthwick.**—At the annual meeting of the Scottish Arboricultural Society the President, Sir Hugh Shaw Stewart, on behalf of the Society, presented Dr. A. W. Borthwick, Professor of Forestry, Aberdeen University, with a writing table and chair as a testimony of their regard and respect and gratitude for his services to the Society as honorary editor of the *Transactions* for fifteen years. The writing table and chair were made in Edinburgh from Scotch-grown Laburnum.

**The Iris Society's Bulletin.**—The Iris Society of which Mr. G. L. Pilkington is President and Hon. Treasurer, Mr. G. N. Bunyard, Hon. Secretary, and Mr. Geo. Dillistone, Hon. Editor, is to be congratulated on the excellent December issue of its *Bulletin*, being No. 4 of the publication. All who are interested in this beautiful genus will find much that is of interest to them in this publication and the various articles cover a wide field. The Society has already instituted a medal to be known as the Dykes Memorial Medal, to commemorate the valuable work on *Irises* done by the late Mr. W. R. Dykes. They now propose to institute a new medal, the Foster Medal, in memory of the late Sir Michael Foster. The Dykes Memorial Medal will be awarded to "meritorious exhibits of *Irises*, or for any signal advance in the way of hybrids that may undergo a test in the Society's trials." The Foster Medal is to be reserved for a special and personal award to anyone contributing to the advance of the genus, hence it is of world-wide and international interest. Amongst the several articles by experts are "Easy Water *Irises*," by Mr. R. E. Spender; "*Iris laevigata*," by Mr. C. W. Christie-Miller; "Eelworms in *Iris Rhizomes*," by G. P. B.; a lengthy account entitled "Report on *Irises*," by Mr. P. J. Murrell, in which varieties seen in France, at Mr. Geoffrey Pilkington's Gardens, Woolton, Mr. G. P. Baker's Gardens, Sevenoaks, at Mrs. Dyke's garden, Sutton Green, and Mr. Bliss's garden, Morwellham, are described. Apparently the most outstanding variety at present in cultivation is W. R. Dykes, which was illustrated in *The Gardeners' Chronicle*, June 19, 1926. The writer states: "all other yellows are trivial compared with this. It is an amazing achievement, and no ordinary description can do it justice." He states that, in his opinion, the best of Mr. Bliss's varieties still hold their place as the finest *Irises* now in cultivation and, with the exception of the new W. R. Dykes, which is quite unique, such varieties as Bruno, Duke of Bedford, Romola, Tenebrae, Gabriel, Pioneer and Valerie West are still superior for size, quality and fine colour combination. Mr. Murrell deprecates the sending of seedlings into commerce that are not absolutely distinct, and he illustrates his argument by three newly introduced yellow varieties, Gold Imperial, Chasseur and Amber, and states that it is inconceivable that all three

are needed as garden plants, and it is unfair to the public that they should be offered without stating that so far as garden effect is concerned, they are very similar. The extensive work done by the late Mr. W. R. Dykes amongst Irises is shown by a list, so far as has been ascertained, of his writings on Irises other than those published in book form, and the great majority of these notes have been published in *The Gardeners' Chronicle*.

**Appointments for the Ensuing Week.**—**TUESDAY, FEBRUARY 22:** Royal Horticultural Society's Committees meet; Wimbledon Gardeners' Society's meeting. **WEDNESDAY, FEB-**

to the "good old times" within my own memory when a special application to be admitted to the *penetratia* was necessary; but there is nothing perfect under the sun, and every fountain has a bitter something, mixing with its sweet waters. Even the "Quarterly" finds fault with the rules, which prevent the harmless Cockney, who has had a hot journey by rail or steam-boat, adding to the pleasure of his summer's holiday, by sitting under the shade of some fine old tree, and discussing a paper of sandwiches, etc. Why is this refused? Does this rule prevail at the Jardin des Plantes, at the Luxembourg, or at Schoenbrunn? I believe not. And why should it? What harm

away; at first I did not see the reason for this singular order, but it was explained that the attendants would not be able to judge whether or not the flowers had been picked in the garden (i.e., stolen). As it was the rule, the flowers were thrown away before entering, I observing that persons having stolen the flowers were not likely to leave the garden with them in their hands. Why, even at the Custom House, ladies' words are taken, as regards what they carry in their work-baskets. *Dodman*. (We take the liberty of expressing an opinion that the rules complained of in the not very decent or accurate article in the "Quarterly," are not only proper but necessary; and so we think

FIG. 61.—CYPRIPEDIUM MRS. ELEY VAR. W. G.

B.H.S. First-Class Certificate, February 8. Flower white, green, purple and brown. Shown by Mr. G. F. Moore, Charwar Bourton-on-the-Water. (see p. 120).

**FRIDAY, FEBRUARY 23:** Sheffield Chrysanthemum Society's meeting; Pangbourne and District Gardeners' Mutual Improvement Association's lecture. **THURSDAY, FEBRUARY 24:** Paisley Florists' Society's meeting. **FRIDAY, FEBRUARY 25:** Association of Economic Biologists' meeting. **SATURDAY, FEBRUARY 26:** Lancaster and District Horticultural Society's lecture.

"Gardeners' Chronicle" Seventy-five Years Ago.—*Kew Gardens*.—The last number of the "Quarterly Review" contains an interesting and amusing article respecting these beautiful gardens, and the rarities to be seen there. No more than justice is done to the admirable mode in which everything is arranged, and the liberal manner in which the public are admitted to the gardens, stoves, etc. What a contrast

would arise: so that the pleasure parties did not make a coffee-room of the museum, or the stoves, or greenhouses? I believe it is only to call attention to this rule to have it reconsidered. It would be well if you were to print the rules *in extenso*, and also to print the annual reports of the curator. There has been much reform as to admission to the Royal Parks and, I believe, persons carrying bundles and servants in livery are now no longer refused admission. There is another rule at Kew which is rather stringent, and in some degree offensive; on the way to the Gardens I had called at Knight and Perry's nursery, and one or two flowers were given to a member of my family who accompanied me, which she carried in her hand; the porter refused her admission, unless the flowers were left in his charge or thrown

is that about flowers). *Gard. Chron.*, February 21, 1852.

**Publications Received.**—*Vegetables for Home and Exhibition*, by E. Beckett; Simpkin, Marshall, Hamilton, Kent and Co., Ltd., 17, Ave Marie Lane, E.C.4; price 15/-.—*The Gardeners' Year Book*, 1927, Williams and Norgate, Ltd., 14, Henrietta Street, W.C.2; price 3/6 net.—*Year Book of Pharmacy and Transactions of the British Pharmaceutical Conference*, 1926; The Pharmaceutical Press, 17, Bloomsbury Square, W.C.1.—*Plants of Glacier National Park*, by Paul C. Standley; Government Printing Office, Washington, D.C.; price 50 cents.—*My Farm in Miniature*, by G. Morland; Faber and Gwyer, Ltd., 24, Russell Square, W.C.1; price 10/6 net.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.
